## Specific Part

### 1 Technical description of the product

The subject of this European Technical Assessment is the post-installed connection, by anchoring or overlap connection joint, of reinforcing bars (rebars) in existing structures made of normal weight concrete, using the "Rebar connection with fischer injection mortar FIS EM Plus" in accordance with the regulations for reinforced concrete construction.

Reinforcing bars with a diameter  $\phi$  from 8 to 40 mm or the fischer rebar anchor FRA of sizes M12 to M24 according to Annex A and the fischer injection mortar FIS EM Plus are used for the post-installed rebar connection. The steel element is placed into a drilled hole filled with injection mortar and is anchored via the bond between embedded reinforcing bar, injection mortar and concrete. The product description is given in Annex A.

### 2 Specification of the intended use in accordance with the applicable European assessment Document

The performances given in Section 3 are only valid if the rebar connection is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the rebar connections of at least 50 and/or 100 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

### 3 Performance of the product and references to the methods used for its assessment

#### 3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Characteristic resistance under static and quasi-static loading	See Annex C1 and C2
Characteristic resistance under seismic loading	See Annex B5 and C3

#### 3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Class A1
Resistance to fire	See Annex C4 and C5

### 4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with European Assessment Document EAD No. 330087-01-0601, the applicable European legal act is: [96/582/EC].

The system to be applied is: 1

# Installation conditions and application examples reinforcing bars, part 1

**Figure A1.1:**

# Installation conditions and application examples fischer rebar anchor FRA

**Figure A3.1:**

Lap to a foundation of a column under bending.

1. Shear lug (or fastener loaded in shear)
2. fischer rebar anchor FRA (tension only)
3. Existing stirrup / reinforcement for overlap (lap splice)
4. Slotted hole

**Figure A3.2:**

Lap of the anchoring of guardrail posts or anchoring of cantilevered building components.

In the anchor plate, the drill holes for the fischer rebar anchors FRA have to be designed as slotted holes with axial direction to the shear force.

1. Fastener for shear load transfer
2. fischer rebar anchor FRA (tension only)
3. Existing stirrup / reinforcement for overlap (lap splice)
4. Slotted hole

The required transverse reinforcement acc. to EN 1992-1-1:2011 is not shown in the figures. **The fischer rebar anchor FRA may be only used for axial tensile force.** The tensile force must transferred by lap to the existing reinforcement of the building. The transfer of the shear force has to be ensured by suitable measure, e.g. by means of shear force or anchors with European Technical Assessment (ETA).

## Properties of reinforcing bars (rebar)

Figure A6.1:

- The minimum value of related rip area  $f_{R,min}$  according to EN 1992-1-1:2011
- The maximum outer rebar diameter over the ribs shall be:
  - The nominal diameter of the rip  $\phi + 2 \cdot h$  ( $h \leq 0,07 \cdot \phi$ )
  - ( $\phi$ : Nominal diameter of the bar;  $h_{rip}$  = rip height of the bar)

**Table A6.1: Installation conditions for rebars**

Nominal diameter of the bar		$\phi$	8 <sup>1)</sup>		10 <sup>1)</sup>		12 <sup>1)</sup>		14	16	20	22	24
Nominal drill hole diameter	$d_0$	[mm]	10	12	12	14	14	16	18	20	25	30	30
Drill hole depth	$h_0$		$h_0 = l_v$										
Effective embedment depth	$l_v$		acc. to static calculation										
Minimum thickness of concrete member	$h_{min}$		$l_v + 30$ ( $\geq 100$ )					$l_v + 2d_0$					

Nominal diameter of the bar		$\phi$	25 <sup>1)</sup>		26	28	30	32	34	36	40	
Nominal drill hole diameter	$d_0$	[mm]	30	35	35	35	40	40	40	45	55	
Drill hole depth	$h_0$		$h_0 = l_v$									
Effective embedment depth	$l_v$		acc. to static calculation									
Minimum thickness of concrete member	$h_{min}$		$l_v + 2d_0$									

<sup>1)</sup> Both drill hole diameters can be used

## Specifications of intended use part 2

### Anchorage subject to:

- Static and quasi-static loading: reinforcing bar (rebar) size 8 mm to 40 mm; FRA M12 to M24
- Characteristic resistance under seismic loading: reinforcing bar (rebar) size 8 mm to 40 mm
- Resistance to fire: reinforcing bar (rebar) size 8 mm to 40 mm; FRA M12 to M24.

### Base materials:

- Compacted reinforced or unreinforced normal weight concrete without fibres according to EN 206:2013+A2:2021
- Strength classes C12/15 to C50/60 according to EN 206:2013+A2:2021
- Maximum chloride content of 0,40 % (CL 0.40) related to the cement content according to EN 206:2013+A2:2021
- Non-carbonated concrete

Note: In case of a carbonated surface of the existing concrete structure the carbonated layer shall be removed in the area of the post-installed rebar connection with a diameter of  $\phi + 60$  mm prior to the installation of the new rebar. The depth of concrete to be removed shall correspond to at least the minimum concrete cover in accordance with EN 1992-1-1:2011. The foregoing may be neglected if building components are new and not carbonated and if building components are in dry conditions

### Use conditions (Environmental conditions) for fischer rebar anchors FRA:

- For all conditions according to EN1993-1-4:2006+A1:2015 corresponding to corrosion resistance classes to **Annex A7 Table A7.2.**

### Design:

- The structural design according to EN 1992-1-1:2011, EN 1992-1-2:2011 and **Annex B3** and **B4** are conducted under responsibility of a designer experienced in the field of anchorages and concrete works.
- Verifiable calculation notes and drawings are prepared taking account of the forces to be transmitted.
- The actual position of the reinforcement in the existing structure shall be determined on the basis of the construction documentation and taken into account when designing.

### Installation:

- The installation of post-installed rebar respectively fischer rebar anchor FRA shall be done only by suitable trained installer and under Supervision on site; the conditions under which an installer may be considered as suitable trained and the conditions for Supervision on site are up to the Member States in which the installation is done.
- Check the position of the existing rebars (if the position of existing rebars is not known, it shall be determined using a rebar detector suitable for this purpose as well as on the basis of the construction documentation and then marked on the building component for the overlap joint).

Rebar connection with fischer injection mortar FIS EM Plus

Intended use  
Specifications part 2

**Annex B2**  
Appendix 10 / 24

## General construction rules for post-installed rebars

**Figure B3.1:**

- Only tension forces in the axis of the rebar may be transmitted
- The transfer of shear forces between new concrete and existing structure shall be designed additionally according to EN 1992-1-1:2011.
- The joints for concreting must be roughened to at least such an extent that aggregate protrude.

<sup>1)</sup> If the clear distance between lapped bars exceeds  $4 \phi$  or 50 mm then the lap length shall be increased by the difference between the clear bar distance and the smaller  $4 \phi$  or 50 mm.

- $c$  concrete cover of post-installed rebar  
 $c_1$  concrete cover at end-face of existing rebar  
 $c_{min}$  minimum concrete cover according to **Table B5.1** and to EN 1992-1-1:2011, Section 4.4.1.2  
 $\phi$  nominal diameter of reinforcing bar  
 $l_0$  lap length, according to EN 1992-1-1:2011 for static loading and according to EN 1998-1:2004+AC:2009, section 5.6.3 for seismic action.  
 $l_v$  effective embedment depth,  $\geq l_0 + c_1$   
 $d_0$  nominal drill bit diameter, see **Annex B6**

Figures not to scale

**Intended use**  
 General construction rules for for post-installed rebars

**Annex B3**  
 Appendix 11 / 24

## General construction rules for post-installed fischer rebar anchors FRA

**Figure B4.1:**

- Only tension forces in the axis of the fischer rebar anchor FRA may be transmitted.
- The tension force must be transferred via an overlap joint to the reinforcement in the building part.
- The transmission of the shear load shall be ensured by appropriate additional measures, e.g. by shear lugs or by anchors with a European Technical Assessment (ETA).
- In the anchor plate, the holes for the tension anchor shall be executed as slotted holes with the axis in the direction of the shear force.
- The length of the bonded-in thread may not be accounted as anchorage.

1) If the clear distance between lapped bars exceeds  $4\phi$  or  $50\text{ mm}$  then the lap length shall be increased by the difference between the clear bar distance and the smaller  $4\phi$  or  $50\text{ mm}$ .

$c$	concrete cover of post-installed fischer rebar anchor FRA
$c_1$	concrete cover at end-face of existing rebar
$c_{\min}$	minimum concrete cover according to <b>Table B5.1</b> and to EN 1992-1-1:2011, Section 4.4.1.2
$\phi$	nominal diameter of reinforcing bar
$l_0$	lap length, according to EN 1992-1-1:2011, Section 8.7.3
$l_{e,\text{ges}}$	overall embedment depth, $\geq l_0 + l_e$
$d_0$	nominal drill bit diameter, see <b>Annex B6</b>
$l_e$	length of the bonded in threaded part
$t_{\text{fix}}$	thickness of the fixture
$l_v$	effective embedment depth

## Safety regulations

Review the Material Safety Data Sheet (SDS) before use for proper and safe handling!

Wear well-fitting protective goggles and protective gloves when working with mortar FIS EM Plus

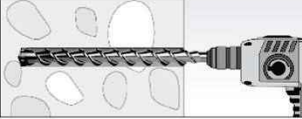

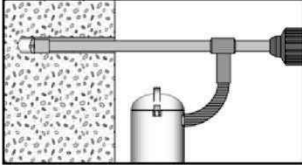

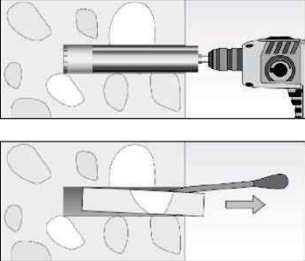

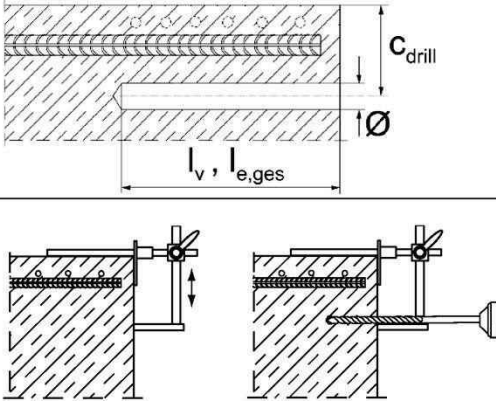

Important: Observe the instructions for use provided with each cartridge.

## Installation instruction part 1; Installation with FIS EM Plus

### Hole drilling

Note: Before drilling, remove carbonized concrete; clean contact areas (see **Annex B2**)

In case of aborted drill holes the drill hole shall be filled with mortar.

1a	<p><b>Hammer drilling or compressed air drilling</b></p> 	<p>Drill the hole to the required embedment depth using a hammer drill with carbide drill bit set in rotation hammer mode or a pneumatic drill. Drill bit sizes see <b>Table B6.2</b>.</p>

### Installation instruction part 3; Installation with FIS EM Plus

reinforcing bars (rebar) / fischer rebar anchor FRA and cartridge preparation

4		<p>Before use, make asure that the rebar or the fischer rebar anchor FRA is dry and free of oil or other residue. Mark the embedment depth <math>l_v</math> on the rebar (e.g. with tape) Insert rebar in borehole, to verify drill hole depth and setting depth <math>l_v</math> resp. <math>l_{e,ges}</math></p>
5		<p>Twist off the sealing cap Twist on the static mixer (the spiral in the static mixer must be clearly visible).</p>
6		<p>Place the cartridge into a suitable dispenser. When using the foilbag, the foil container holder must be used.</p>
7		<p>Press out approximately 10 cm of mortar until the resin is permanently grey in colour. Mortar which is not grey in colour will not cure and must be disposed.</p>

Rebar connection with fischer injection mortar FIS EM Plus

**Intended use**

Installation instruction part 3,  
reinforcing bars (rebar) / fischer rebar anchor and cartridge preparation

**Annex B9**  
Appendix 17 / 24

## Installation instruction part 4; Installation with FIS EM Plus

### Injection of the mortar; borehole depth ≤ 250 mm

8a

Inject the mortar from the back of the hole towards the front and slowly withdraw the mixing nozzle step by step with each trigger pull. Avoid bubbles.

Fill holes approximately 2/3 full, to ensure that the annular gap between the rebar and the concrete will be completely filled with adhesive over the entire embedment length.

The conditions for mortar injection without extension tube can be found in **Table B5.3**.

After injecting, release the dispenser. This will prevent further mortar discharge from the mixing nozzle.

### Injection of the mortar; borehole depth > 250 mm

8b

Assemble mixing nozzle FIS MR Plus or FIS UMR, extension tube and appropriate injection adapter (see **Table B 6.2**).

Mortar level mark

Mark the required mortar level  $l_m$  and embedment depth  $l_v$  resp.  $l_{e,ges}$  with tape or marker on the injection extension tube.

a) Estimation:

$$l_m = \frac{1}{3} * l_v \text{ resp. } l_m = \frac{1}{3} * l_{e,ges} \text{ [mm]}$$

b) Precise equation for optimum mortar volume:

$$l_m = l_v \text{ resp. } l_{e,ges} \left( (1,2 * \frac{d_s^2}{d_0^2} - 0,2) \right) \text{ [mm]}$$

Mortar level mark

Insert injection adapter to back of the hole. Begin injection allowing the pressure of the injected adhesive mortar to push the injection adapter towards the front of the hole. Do not actively pull out!

Fill holes approximately 2/3 full, to ensure that the annular gap between the rebar and the concrete will be completely filled with adhesive over the embedment length.

When using an injection adapter continue injection until the mortar level mark  $l_m$  becomes visible.

Maximum embedment depth see **Table B5.2**.

After injecting, release the dispenser. This will prevent further mortar discharge from the mixing nozzle.

Rebar connection with fischer injection mortar FIS EM Plus

**Intended use**

Installation instruction part 4, mortar injection

**Annex B10**

Appendix 18 / 24

## Installation instruction part 5; Installation with FIS EM Plus

### Insert rebar / fischer rebar anchor FRA

9		<p>Insert the rebar / fischer rebar anchor FRA slowly twisted into the borehole until the embedment mark is reached.</p> <p>Recommendation: Rotation back and forth of the reinforcement bar or the fischer rebar anchor FRA makes pushing easy.</p>
10		<p>For overhead installation, support the rebar / fischer rebar anchor FRA and secure it from falling till mortar started to harden, e.g. using wedges.</p>
11		<p>After installing the rebar or fischer rebar anchor FRA the annular gap must be completely filled with mortar.</p> <p>Proper installation</p> <ul style="list-style-type: none"> <li>• Desired embedment depth is reached <math>l_v</math>: embedment mark at concrete surface.</li> <li>• Excess mortar flows out of the borehole after the rebar has been fully inserted up to the embedment mark.</li> </ul>
12		<p>Observe the working time "<math>t_{work}</math>" (see <b>Table B6.1</b>), which varies according to temperature of base material. Minor adjustments to the rebar / fischer rebar anchor position may be performed during the working time</p> <p>After the initial curing time <math>t_{cure,ini}</math> (see <b>Table B6.1</b>) is reached, the initial bond strength is achieved and allows further processing.</p> <p>Full load may be applied only after the curing time "<math>t_{cure}</math>" has elapsed (see <b>Table B 6.1</b>)</p>
13		<p>Mounting the fixture for fischer rebar anchor FRA, max <math>T_{inst}</math> see <b>Table A7.1</b>.</p>

Appendix 23 / 24

## Bond strength $f_{bk,fi} = f_{bk,fi,100y}$ at increased temperature for concrete strength classes C12/15 to C50/60 (all drilling methods)

The bond strength  $f_{bk,fi} = f_{bk,fi,100y}$  at increased temperature has to be calculated by the following equation:

$$f_{bk,fi} = f_{bk,fi,100y} = k_{fi}(\theta) \cdot f_{bd,PIR} \cdot \frac{\gamma_c}{\gamma_{M,fi}}$$

If:  $\theta > 46 \text{ }^\circ\text{C}$        $k_{fi}(\theta) = \frac{862,3 \cdot \theta^{-1,166}}{f_{bd,PIR} \cdot 4,3} \leq 1,0$

If:  $\theta > \theta_{max} (284 \text{ }^\circ\text{C})$        $k_{fi}(\theta) = 0$

$f_{bk,fi}$ =	=	Bond strength at increased temperature in N/mm <sup>2</sup> for service life 50 years
$f_{bk,fi,100y}$	=	Bond strength at increased temperature in N/mm <sup>2</sup> for service life 100 years
$\theta$	=	Temperature in °C in the mortar layer
$k_{fi}(\theta)$	=	Reduction factor at increased temperature
= $k_{fi,100y}(\theta)$		
$f_{bd,PIR}$ =	=	Design value of the bond strength in N/mm <sup>2</sup> in cold condition according to table C2.1 considering the concrete classes, the rebar diameter, the drilling method and the bond conditions according to EN 1992-1-1:2011
$\gamma_c$	=	1,5 recommended partial factor according to EN 1992-1-1:2011
$\gamma_{M,fi}$	=	1,0 recommended partial factor according to EN 1992-1-2:2011

For evidence at increased temperature the anchorage length shall be calculated according to EN 1992-1-1:2011 Equation 8.3 using the temperature-dependent ultimate bond strength  $f_{bk,fi}$ .

**Figure C5.1:** Example graph of reduction factor  $k_{fi}(\theta)$  for concrete class C20/25 for good bond conditions
