

DEKLARACJA WŁAŚCIWOŚCI UŻYTKOWYCH

DoP 0296

dla systemu wklejanego fischer FIS EB II (Zaprawa do wklejania dodatkowych połączeń prętów zbrojeniowych)

PL

1. Niepowtarzalny kod identyfikacyjny typu wyrobu: DoP 0296
2. Zamierzone zastosowanie: System do wklejania prętów zbrojeniowych z zaprawą do stosowania w betonie, Zobacz załącznik, w szczególności aneksy B1-B12.
3. Producent: fischerwerke GmbH & Co. KG, Otto-Hahn-Straße 15, 79211 Denzlingen, Niemcy
4. Upoważniony przedstawiciel: -
5. System(-y) oceny i weryfikacji stałości właściwości użytkowych: 1
6. Europejski dokument oceny: EAD 330087-01-0601 Edition 06/2021
Europejska ocena techniczna: ETA-21/0470; 2022-03-03
Jednostka ds. oceny technicznej: DIBt- Deutsches Institut für Bautechnik
Jednostka lub jednostki notyfikowane: 2873 TU Darmstadt
7. Deklarowane właściwości użytkowe:
Wytrzymałość mechaniczna i stabilność osadzenia (BWR 1)
Nośność charakterystyczna pod obciążeniem statycznym i quasi-statycznym:
Siła wiązania wklejanego pręta zbrojeniowego: Aneks C2
Współczynnik redukujący: Aneks C1
Współczynnik wzmocnienia dla minimalnej długości zakotwienia: Aneks C1
Nośność charakterystyczna na zniszczenie stali dla prętów zbrojeniowych: Aneks C1

Nośność charakterystyczna pod obciążeniem sejsmicznym:
Wytrzymałość wiązania pod obciążeniem sejsmicznym, współczynnik efektywności wiązania sejsmicznego: NPD
Minimalna pokrywa betonowa pod obciążeniem sejsmicznym: NPD

Ochrona przeciwpożarowa (BWR 2)
Odporność ogniowa: Klasy (A1)

Odporność na działanie ognia:
Wytrzymałość wiązania w podwyższonej temperaturze dla wklejanych prętów zbrojeniowych oceniana na 50 lat: Aneks C3
Wytrzymałość wiązania w podwyższonej temperaturze dla wklejanych prętów zbrojeniowych oceniana na 100 lat: NPD
Nośność charakterystyczna na zniszczenie stali dla prętów zbrojeniowych pod wpływem ekspozycji na ogień: Aneks C2
8. Odpowiednia dokumentacja techniczna lub specjalna dokumentacja techniczna: -

$f_{td,PIR,100y}$ = NPD

$k_{b,100y}$ = NPD

$\alpha_{lb,100y}$ = NPD

Właściwości użytkowe określonego powyżej wyrobu są zgodne z zestawem deklarowanych właściwości użytkowych. Niniejsza deklaracja właściwości użytkowych wydana zostaje zgodnie z rozporządzeniem (UE) nr 305/2011 na wyłączną odpowiedzialność producenta określonego powyżej.

W imieniu producenta podpisał(-a):

Dr.-Ing. Oliver Geibig, Dyrektor Zarządzający ds. Jednostek Biznesowych i Inżynierii
Tumlingen, 2022-03-17

Jürgen Grün, Dyrektor Zarządzający ds. Chemii i Jakości

Niniejsza Deklaracja Właściwości Użytkowych została przygotowana w różnych językach. W razie wątpliwości w interpretacji, wersja angielska jest zawsze miarodajna.

Załącznik zawiera dobrowolne i uzupełniające informacje w języku angielskim (neutralne językowo), a wykraczające poza wymagania prawne.

Specific Part

1 Technical description of the product

The subject of this European Technical Assessment is the post-installed connection, by anchoring or overlap connection joint, of reinforcing bars (rebars) in existing structures made of normal weight concrete, using the "Rebar connection with fischer Injection system FIS EB II" in accordance with the regulations for reinforced concrete construction.

Reinforcing bars made of steel with a diameter ϕ from 8 to 32 mm or the fischer rebar anchor FRA of sizes M12 to M24 according to Annex A and injection mortar FIS EB II are used for rebar connections. The steel element is placed into a drilled hole filled with injection mortar FIS EB II and is anchored via the bond between rebar, injection mortar and concrete.

The product description is given in Annex A.

2 Specification of the intended use in accordance with the applicable European assessment Document

The performances given in Section 3 are only valid if the rebar connection is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the rebar connections of at least 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Characteristic resistance under static and quasi-static loading	See Annex C 1
Characteristic resistance under seismic loading	No performance assessed

3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Class A1
Resistance to fire	See Annex C 2 to C 3

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with European Assessment Document EAD No. 330087-01-0601, the applicable European legal act is: [96/582/EC].

The system to be applied is: 1

Installation conditions and application examples reinforcing bars, part 1

Installation conditions and application examples reinforcing bars, part 2

Figure A2.1:

Rebar connection for components stressed primarily in compression

Figure A2.2:

Anchoring of reinforcement to cover the line of acting tensile force in the bending member

(only post-installed rebar is plotted)

Key to Figure

- T Acting tensile force
- E Envelope of $M_{ed} / z + N_{ed}$ (see EN 1992-1-1:2004+AC:2010)
- x Distance between the theoretical point of support and concrete joint

Note to **figure A1.1 to A1.3** and **figure A2.1 to A2.2**

In the figures no traverse reinforcement is plotted, the transverse reinforcement as required by EN 1992-1-1:2004+AC:2010 shall be present.

The shear transfer between old and new concrete shall be designed according to EN 1992-1-1:2004+AC:2010
Preparation of joints according to **Annex B 3** of this document.

Installation conditions and application examples fischer rebar anchor

Figure A3.1:

Lap to a foundation of a column under bending.

1. Shear lug (or fastener loaded in shear)
2. fischer rebar anchor (tension only)
3. Existing stirrup / reinforcement for overlap (lap splice)
4. Slotted hole

Figure A3.2:

Lap of the anchoring of guardrail posts or anchoring of cantilevered building components.

In the anchor plate, the drill holes for the fischer rebar anchors have to be designed as slotted holes with axial direction to the shear force.

1. Fastener for shear load transfer
2. fischer rebar anchor (tension only)
3. Existing stirrup / reinforcement for overlap (lap splice)
4. Slotted hole

The required transverse reinforcement acc. to EN 1992-1-1:2004+AC:2010 is not shown in the figures. **The fischer rebar anchor may be only used for axial tensile force.** The tensile force must be transferred by lap to the existing reinforcement of the building. The transfer of the shear force has to be ensured by suitable measures, e.g. by means of shear force or anchors with European Technical Assessment (ETA).

Specifications part 1

Annex B 1

Appendix 8/22

Specifications of intended use part 2

Anchorage subject to:

- Static and quasi-static loading: reinforcing bar (rebar) size 8 mm to 32 mm
- Resistance to fire

Base materials:

- Compacted reinforced or unreinforced normal weight concrete without fibres according to EN 206:2013+A1:2016.
- Concrete strength classes C12/15 to C50/60 according to EN 206:2013+A1:2016
- Maximum chloride content of 0,40 % (CL 0.40) related to the cement content according to EN 206:2013+A1:2016
- Non-carbonated concrete

Note: In case of a carbonated surface of the existing concrete structure, the carbonated layer shall be removed in the area of the post-installed rebar connection with a diameter of $\phi + 60$ mm prior to the installation of the new rebar. The depth of concrete to be removed shall correspond to at least the minimum concrete cover in accordance with EN 1992-1-1 :2004+AC:2010. The foregoing may be neglected if building components are new and not carbonated and if building components are in dry conditions.

Use conditions (Environmental conditions) for fischer rebar anchors:

- For all conditions according to EN 1993-1-4:2006+A1:2015 corresponding to corrosion resistance classes to Annex A 6 table A6.2

Design:

- Fastenings are designed under the responsibility of an engineer experienced in fastenings and concrete work.
- Verifiable calculation notes and drawings are prepared taking account of the forces to be transmitted.
- Design according to EN 1992-1-1:2004+AC:2010, EN 1992-1-2:2004+AC:2008 and Annex B 3 and B 4.
- The actual position of the reinforcement in the existing structure shall be determined on the basis of the construction documentation and taken into account when designing.

Installation:

- The installation of post-installed rebar respectively fischer rebar anchor shall be done only by suitable trained installer and under supervision on site; the conditions under which an installer may be considered as suitable trained and the conditions for Supervision on site are up to the member states in which the installation is done.
- Check the position of the existing rebars (if the position of existing rebars is not known, it shall be determined using a rebar detector suitable for this purpose as well as on the basis of the construction documentation and then marked on the building component for the overlap joint).

Rebar connection with fischer injection system FIS EB II

Intended Use
Specifications part 2

Annex B 2

Appendix 9/22

General construction rules for post-installed rebars

Figure B3.1:

- Only tension forces in the axis of the rebar may be transmitted.
- The transfer of shear forces between new concrete and existing structure shall be designed additionally according to EN 1992-1-1:2004+AC:2010.
- The joints for concreting must be roughened to at least such an extent that aggregate protrude.

¹⁾ If the clear distance between lapped bars exceeds 4ϕ then the lap length shall be increased by the difference between the clear bar distance and 4ϕ

c	concrete cover of post-installed rebar
c_1	concrete cover at end-face of existing rebar
c_{min}	minimum concrete cover according to table B5.1 and to EN 1992-1-1:2004+AC:2010, Section 4.4.1.2
ϕ	nominal diameter of reinforcing bar
l_0	lap length, according to EN 1992-1-1:2004+AC:2010
l_v	effective embedment depth, $\geq l_0 + c_1$
d_0	nominal drill bit diameter, see Annex B 6

Appendix 10/22

General construction rules for post-installed fischer rebar anchors

Figure B4.1:

- Only tension forces in the axis of the fischer rebar anchor may be transmitted.
- The tension force must be transferred via an overlap joint to the reinforcement in the building part.
- The transmission of the shear loading shall be ensured by appropriate additional measures, e.g. by shear lugs or by anchors with a European Technical Assessment (ETA).
- In the anchor plate, the holes for the tension anchor shall be executed as slotted holes with the axis in the direction of the shear force.

¹⁾ If the clear distance between lapped bars exceeds 4ϕ then the lap length shall be increased by the difference between the clear bar distance and 4ϕ .

Safety regulations

Review the Safety Data Sheet (SDS) before use for proper and safe handling!
Wear well-fitting protective goggles and protective gloves when working with mortar FIS EB II.
Important: Observe the instructions for use provided with each cartridge.

Installation instruction part 1

Hole drilling

Note: Before drilling, remove carbonated concrete; clean contact areas (see Annex B 2)
In case of aborted drill holes the drill hole shall be filled with mortar.

1	Hammer drilling or compressed air drilling  Drill the hole to the required embedment depth using a hammer drill with carbide drill bit set in rotation hammer mode or a pneumatic drill. Drill bit sizes see table B6.2.
2	 Measure and control concrete cover c ($c_{drill} = c + \varnothing / 2$) Drill parallel to surface edge and to existing rebar. Where applicable use fischer drilling aid.  For holes $l_v > 20$ cm use drilling aid. Three different options can be considered: A) fischer drilling aid B) Slat or spirit level C) Visual check Minimum concrete cover c_{min} see table B5.1

Rebar connection with fischer injection system FIS EB II	
Intended Use Safety regulations; Installation instruction part 1, hole drilling	Annex B 7 Appendix 14/22

Installation instruction part 2

Drill hole cleaning with oil-free compressed air

3a

Blowing

twice from the back of the hole with the appropriate nozzle (oil-free compressed air ≥ 6 bar) until return air stream is free of noticeable dust.

Personal protective equipment must be used (see safety regulations **Annex B 7**).

Brushing (with power drill)

Check steel brush with brush control template. The brush must produce a noticeable resistance when it is inserted into the drill hole.

Fix an adequate steel brush with an extension into a drilling machine and brush the bore hole twice.

Blowing

twice from the back of the hole with the appropriate nozzle (oil-free compressed air ≥ 6 bar) until return air stream is free of noticeable dust.

Personal protective equipment must be used (see safety regulations **Annex B 7**).

Go to step 4

Rebar connection with fischer injection system FIS EB II

Intended Use

Installation instruction part 2, drill hole cleaning

Annex B 8

Appendix 15/22

Installation instruction part 3

Drill hole cleaning: manual cleaning is permitted for hammer drilled boreholes up to hole diameters $d_0 < 18 \text{ mm}$ and depths l_v resp. $l_{e,ges} \leq 12 \cdot \phi$

3b		Blowing blow out the hole twice by hand from the back of the hole. Use only the fischer blow out pump AB G. Personal protective equipment must be used (see safety regulations Annex B 7).
		Brushing Twice with the specified brush size by inserting the round steel brush to the back of the hole and twisting motion. The brush must produce a noticeable resistance when it is inserted into the drill hole. Corresponding brushes see table B6.2.
		Blowing blow out the hole twice by hand from the back of the hole. Use only the fischer blow out pump AB G. Personal protective equipment must be used (see safety regulations Annex B 7).

Intended Use Installation instruction part 3, drill hole cleaning		

Installation instruction part 4

reinforcing bars (rebar) / fischer rebar anchor and cartridge preparation

4		Before use, make asure that the rebar or the fischer rebar anchor is dry and free of oil or other residue. Mark the embedment depth (e.g. with tape) Insert rebar in borehole, to verify drill hole depth and setting depth
5		Twist off the sealing cap Twist on the static mixer (the spiral in the static mixer must be clearly visible).
6		Place the cartridge into a suitable dispenser.
7		Press out approximately 10 cm of mortar until the resin is permanently grey in colour. Mortar which is not grey in colour will not cure and must be disposed.

Go to step 8

Rebar connection with fischer injection system FIS EB II

Intended Use

Installation instruction part 4,
reinforcing bars (rebar) / fischer rebar anchor and cartridge preparation

Annex B 10

Appendix 17/22

Installation instruction part 5; Installation with FIS EB II

Injection of the mortar without extension tube

8a

Inject the mortar from the back of the hole towards the front and slowly withdraw the static mixer step by step with each trigger pull. Avoid bubbles.
Fill holes approximately 2/3 full, to ensure that the annular gap between the rebar and the concrete will be completely filled with adhesive over the entire embedment length.
The conditions for mortar injection without extension tube can be found in **table B5.3**

After injecting, release the dispenser. This will prevent further mortar discharge from the static mixer.

Injection of the mortar with extension tube

8b

Assemble mixing nozzle FIS MR Plus or FIS UMR, extension tube and appropriate injection adapter (see **table B6.2**)

Mortar level mark

Mark the required mortar level l_m and embedment depth l_v resp. $l_{e,ges}$ with tape or marker on the injection extension tube.

a) Estimation:

$$l_m = \frac{1}{3} \cdot l_v \text{ resp. } l_m = \frac{1}{3} \cdot l_{e,ges} \text{ [mm]}$$

b) Precise equation for optimum mortar volume:

$$l_m = l_v \text{ resp. } l_{e,ges} \left(\left(1,2 \cdot \frac{d_s^2}{d_0^2} - 0,2 \right) \right) \text{ [mm]}$$

Mortar level mark

Insert injection adapter to back of the hole. Begin injection allowing the pressure of the injected adhesive mortar to push the injection adapter towards the front of the hole. Do not actively pull out!
Fill holes approximately 2/3 full, to ensure that the annular gap between the rebar and the concrete will be completely filled with adhesive over the embedment length.
When using an injection adapter continue injection until the mortar level mark l_m becomes visible.
Maximum embedment depth, see **table B5.2**

After injecting, release the dispenser. This will prevent further mortar discharge from the static mixer.

Go to step 9

Rebar connection with fischer injection system FIS EB II

Intended Use

Installation instruction part 5, mortar injection

Annex B 11

Appendix 18/22

Installation instruction part 6; Inatallation with FIS EB II

Insert rebar / fischer rebar anchor

9		Insert the rebar / fischer rebar anchor slowly twisted into the borehole until the embedment mark is reached. Recommendation: Rotation back and forth of the reinforcement bar or the fischer rebar anchor makes pushing easy
10		After installing the rebar or fischer rebar anchor the annular gap must be completely filled with mortar. Proper installation - Desired embedment depth is reached l_v resp. $l_{e,ges}$: embedment mark at concrete surface - Excess mortar flows out of the borehole after the rebar or fischer rebar anchor have been fully inserted up to the embedment mark.
11		For overhead installation, support the rebar / fischer rebar anchor and secure it from falling till mortar started to harden, e.g. using wedges.
12		Observe the working time "t_{work}" (see table B6.1), which varies according to temperature of base material. Minor adjustments to the rebar / fischer rebar anchor position may be performed during the working time Full load may be applied only after the curing time "t_{cure}" has elapsed (see table B6.1)
13		Mounting the fixture, max T_{inst} see table A6.1

Rebar connection with fischer injection system FIS EB II

Intended Use

Installation instruction part 6, insert rebar / fischer rebar anchor

Annex B 12

Appendix 19/22

Minimum anchorage length and minimum lap length

The minimum anchorage length $l_{b,min}$ and the minimum lap length $l_{o,min}$ according to EN 1992-1-1:2004+AC:2010 shall be multiplied by the relevant amplification factor α_{lb} according to **table C1.1**.

Table C1.1: Amplification factor α_{lb} related to concrete strength class and drilling method

Hammer drilling and compressed air drilling

Rebar / fischer rebar anchor ϕ [mm]	Amplification factor α_{lb}								
	Concrete strength class								
	C12/15	C16/20	C20/25	C25/30	C30/37	C35/45	C40/50	C45/55	C50/60
8 to 32	1,0								

Table C1.2: Bond efficiency factor k_b for hammer drilling and compressed air drilling

Hammer drilling and compressed air drilling

Rebar / fischer rebar anchor ϕ [mm]	Bond efficiency factor k_b								
	Concrete strength class								
	C12/15	C16/20	C20/25	C25/30	C30/37	C35/45	C40/50	C45/55	C50/60
8 to 32	1,0								

Table C1.3: Characteristic tensile yield strength for rebar part of fischer rebar anchors

fischer rebar anchor FRA / FRA HCR		M12	M16	M20	M24
Characteristic tensile yield strength for rebar part					
Rebar diameter	ϕ [mm]	12	16	20	25
Characteristic tensile yield strength	f_{yk} [N/mm ²]	500	500	500	500
Partial factor for rebar part	$\gamma_{Ms,N}^{1)}$ [-]	1,15			

¹⁾ In absence of national regulations

Table C1.4: Characteristic resistance to steel failure under tension loading of fischer rebar anchors

fischer rebar anchor FRA / FRA HCR		M12	M16	M20	M24
Characteristic resistance to steel failure under tension loading					
Characteristic resistance	$N_{Rk,s}$ [kN]	62	111	173	263
Partial factor					
Partial factor	$\gamma_{Ms,N}^{1)}$ [-]	1,4			

¹⁾ In absence of national regulations

Rebar connection with fischer injection system FIS EB II

Performances

Amplification factor α_{lb} , bond efficiency factor k_b , characteristic resistance to steel failure of fischer rebar anchors; characteristic tensile yield strength for rebar part

Annex C 1

Appendix 20/22

Table C2.1: Design values of the bond strength $f_{bd,PIR}$ in N/mm² for hammer drilling, compressed air drilling

$$f_{bd,PIR} = k_b \cdot f_{bd}$$

f_{bd} : Design value of the bond strength in N/mm² considering the concrete strength classes and the rebar diameter for good bond condition (for all other bond conditions multiply the values by $\eta_1 = 0,7$) and recommended partial factor $\gamma_c = 1,5$ according to EN 1992-1-1: 2004+AC:2010

k_b : Bond efficiency factor according to **table C1.2**

Hammer drilling and compressed air drilling

Rebar / fischer rebar anchor ϕ [mm]	bond strength $f_{bd,PIR}$ [N/mm ²]								
	Concrete strength class								
	C12/15	C16/20	C20/25	C25/30	C30/37	C35/45	C40/50	C45/55	C50/60
8 to 32	1,7	2,0	2,3	2,7	3,0	3,4	3,7	4,0	4,3

Table C2.2: Characteristics resistance to **steel failure** for **fischer rebar anchors** under tension loading and fire exposure R30 to R120

fischer rebar anchor FRA / FRA HCR				M12	M16	M20	M24
Characteristic resistance to steel failure under tension loading and fire exposure	R30	$N_{Rk,s,fi}$	[kN]	2,5	4,7	7,4	10,6
	R60			2,1	3,9	6,1	8,8
	R90			1,7	3,1	4,9	7,1
	R120			1,3	2,5	3,9	5,6

Rebar connection with fischer injection system FIS EB II

Performances

Design values of the bond strength $f_{bd,PIR}$; characteristic resistance to steel failure for fischer rebar anchor $N_{Rk,s,fi}$ under tension loading and fire exposure

Annex C 2

Appendix 21/22

The bond strength $f_{bd,fi}$ at increased temperature for concrete strength classes C12/15 to C50/60 (all drilling methods)

The bond strength $f_{bd,fi}$ at increased temperature has to be calculated by the following equation:

$$f_{bd,fi} = k_{fi}(\theta) \cdot f_{bd,PIR} \cdot \frac{\gamma_c}{\gamma_{m,fi}}$$

If: $\theta > 49\text{ }^{\circ}\text{C}$ $k_{fi}(\theta) = \frac{39924 \cdot \theta^{-2,134}}{f_{bd,PIR} \cdot 4,3} \leq 1.0$

If: $\theta > \theta_{max} (200\text{ }^{\circ}\text{C})$ $k_{fi}(\theta) = 0$

- $f_{bd,fi}$ = The bond strength at increased temperature in N/mm^2
- (θ) = Temperature in $^{\circ}\text{C}$ in the mortar layer
- $k_{fi}(\theta)$ = Reduction factor at increased temperature
- $f_{bd,PIR}$ = Design value of the bond strength in N/mm^2 in cold condition according to table C2.1 considering the concrete strength classes, the rebar diameter, the drilling method and the bond conditions according to EN 1992-1-1:2004+AC:2010
- γ_c = 1,5 recommended partial factor according to EN 1992-1-1:2004+AC:2010
- $\gamma_{m,fi}$ = 1,0 recommended partial factor

For evidence at increased temperature the anchorage length shall be calculated according to EN 1992-1-1:2004+AC:2010 Equation 8.3 using the temperature-dependent ultimate bond strength $f_{bd,fi}$.

Figure C3.1: Example of the graph of reduction factor $k_{fi}(\theta)$ for concrete strength class C20/25 for good bond conditions

Rebar connection with fischer injection system FIS EB II

Performances

Design values of bond strength $f_{bd,fi}$ at increased temperature

Annex C 3

Appendix 22/22
