Specific Part

1 Technical description of the product

The subject of this European technical assessment is the post-installed connection, by anchoring or overlap connection joint, of reinforcing bars (rebars) in existing structures made of normal weight concrete, using the fischer injection system FIS EM Plus in accordance with the regulations for reinforced concrete construction.
Reinforcing bars with a diameter ϕ from 8 to 40 mm according to Annex A and the injection mortar FIS EM Plus are used for the post-installed rebar connection. The rebar is placed into a drilled hole filled with injection mortar and is anchored via the bond between embedded reinforcing bar, injection mortar and concrete.

The product description is given in Annex A.

2 Specification of the intended use in accordance with the applicable European assessment Document

The performances given in Section 3 are only valid if the rebar connection is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the rebar connections of at least 50 and/or 100 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Characteristic resistance to tension load (static and quasi-static loading)	See Annex C 1 to C 3
Characteristic resistance to tension load (seismic loading)	See Annex C 4

3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Class A1

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

In accordance with European Assessment Document EAD No. 332402-00-0601-v02, the applicable European legal act is: [96/582/EC].

The system to be applied is: 1

Service temperature	Temperature range I	-40 °C to +60 °C	(max. short term temperature +60 °C; max. long term temperature +35 °C)
	Temperature range II	-40 °C to +72 °C	(max. short term temperature +72 °C; max. long term temperature +50 °C)

Specifications of intended use part 2

Anchorages subject to:

- Static and quasi-static loading: reinforcing bar (rebar) size 8 mm to 40 mm
- Seismic action: reinforcing bar (rebar) size 8 mm to 40 mm

Base materials:

- Compacted reinforced or unreinforced normal weight concrete without fibres according to EN 206:2013+A1:2016.
- Strength classes C20/25 to C50/60 according to EN 206:2013+A1:2016
- Maximum chloride content of 0,40 % (CL 0.40) related to the cement content according to EN 206:2013+A1:2016
- Non-carbonated concrete
  Note: In case of a carbonated surface of the existing concrete structure, the carbonated layer shall be removed in the area of the post-installed rebar connection with a diameter of ϕ + 60 mm prior to the installation of the new rebar. The depth of concrete to be removed shall correspond to at least the minimum concrete cover in accordance with EN 1992-1-1 :2004+AC:2010. The foregoing may be neglected if building components are new and not carbonated and if building components are in dry conditions.

Design:

- Fastenings are designed under the responsibility of an engineer experienced in fastenings and concrete work.
- Verifiable calculation notes and drawings are prepared taking account of the forces to be transmitted.
- Design under static and quasi-static loading and for seismic actions in accordance with EOTA Technical Report TR 069 June 2021.
- The actual position of the reinforcement in the existing structure shall be determined on the basis of the construction documentation and taken into account when designing.
- The shear force must be transferred via the rough joint; the subsequent reinforcement must not be applied for shear force transfer.

Installation:

- Rebar installation carried out by appropriately qualified personnel and under the supervision of the person responsible for technical matters of the site.
- Check the position of the existing rebars (if the position of existing rebars is not known, it shall be determined using a rebar detector suitable for this purpose as well as on the basis of the construction documentation and then marked on the building component for the overlap joint).
- Rebars in overhead installation have to be fixed in their position until the injection mortar is cured.

Table B3.1: Minimum concrete cover c_{min} [1)] depending on the drilling method and the drilling tolerance [2)]

Drilling method	nominal diameter of reinforcing bar ϕ [mm]	Minimum concrete cover c_{min} Without drilling aid [mm]	Minimum concrete cover c_{min} With drilling aid [mm]	
Hammer drilling with standard drill bit	< 25	30 mm + 0,06 l_b ≥ 2 ϕ	30 mm + 0,02 l_b ≥ 2 ϕ	 Drilling aid
	≥ 25	40 mm + 0,06 l_b ≥ 2 ϕ	40 mm + 0,02 l_b ≥ 2 ϕ	
Hammer drilling with hollow drill bit (fischer "FHD", Heller "Duster Expert"; Bosch „Speed Clean"; Hilti "TE-CD, TE-YD")	< 25	30 mm + 0,06 l_b ≥ 2 ϕ	30 mm + 0,02 l_b ≥ 2 ϕ	
	≥ 25	40 mm + 0,06 l_b ≥ 2 ϕ	40 mm + 0,02 l_b ≥ 2 ϕ	

[1)] Note: The minimum concrete cover as specified in EN 1992-1-1:2004+AC:2010 must be observed.
[2)] Minimum clear spacing is a = max (40 mm; 4 · ϕ)

Table B3.2: Dispensers and cartridge sizes corresponding to maximum embedment depth $l_{b,max}$

reinforcing bars (rebar)	Manual dispenser	Pneumatic or cordless dispenser (small)	Pneumatic or cordless dispenser (large)
	Cartridge size 390 ml, 585 ml	Cartridge size 390 ml, 585 ml	Cartridge size 1500 ml

Table B4.1: Conditions for use **static mixer** without an **extension tube**

Nominal drill hole diameter		d_0	[mm]	10	12	14	16	18	20	24	25	28	30	35	40
Drill hole depth h_0 by using	FIS MR Plus			≤90		≤120	≤140	≤150	≤160	≤190	≤210				
	FIS UMR			-	-	≤90	≤160	≤180	≤190	≤220		≤250			

Table B4.2: **Working times** t_{work} and **curing times** t_{cure}

Temperature at anchoring base [°C]	Maximum processing time 1) t_{work}	Minimum curing time 2) t_{cure}
-5 to 0	240 min 3)	200 h
>0 to 5	150 min 3)	90 h
>5 to 10	120 min 3)	40 h
>10 to 20	30 min	18 h
>20 to 30	14 min	10 h
>30 to 40	7 min 4)	5 h

1) Maximum time from the beginning of the injection to the setting and the final positioning of the rebar
2) For wet concrete the curing time must be doubled
3) If the temperature in the concrete falls below 10 °C the cartridge must be warmed up to +15 °C.
4) If the temperature in the concrete exceeds 30 °C the cartridge must be cooled down to +15 °C up to 20 °C

Table B4.3: Installation tools for drilling and cleaning the bore hole and injection of the mortar

reinforcing bars (rebar)	Drilling and cleaning				Injection	
	Nominal drill bit diameter	Diameter of cutting edge	Steel brush diameter	Diameter of cleaning nozzle3)	Diameter of extension tube	Injection adapter
ϕ [mm]	d_0 [mm]	d_{cut} [mm]	d_b [mm]	[mm]	[mm]	[colour]
8 1)	10 2)	≤ 10,50	11	---	9	---
	12	≤ 12,50	14	11		nature
10 1)	12	≤ 12,50	14			
	14	≤ 14,50	16			blue
12 1)	14	≤ 14,50	16	15		
	16	≤ 16,50	20			red
14	18	≤ 18,50	20		9 or 15	yellow
16	20	≤ 20,55	25	19		green
20	25	≤ 25,55	27			black
22 / 24	30	≤ 30,55	32	28		grey
25 1)	30	≤ 30,55	32			grey
	35	≤ 35,70	37			brown
26 / 28	35	≤ 35,70	37			brown
30 / 32 / 34	40 2)	≤ 40,70	42	38		red
36	45 2)	≤ 45,70	47			yellow
40	55 2)	≤ 55,70	58			nature

1) Both drill bit diameters can be used
2) Only hammer drilling with standard drill bit
3) Cleaning nozzle and extension is only necessary if bore hole depth is greater than the length of compressed-air cleaning tool

Safety regulations

Review the Safety Data Sheet (SDS) before use for proper and safe handling!

Wear well-fitting protective goggles and protective gloves when working with mortar FIS EM Plus.

Important: Observe the instructions for use provided with each cartridge.

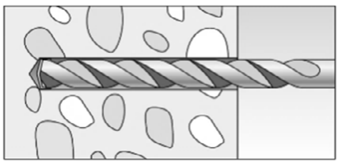
Installation instruction part 1

Hole drilling

Note: Before drilling, remove carbonated concrete; clean contact areas (see Annex B 2)
In case of aborted drill holes the drill hole shall be filled with mortar.

1a

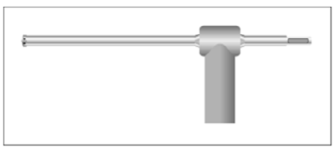
Hammer drilling with standard drill bit



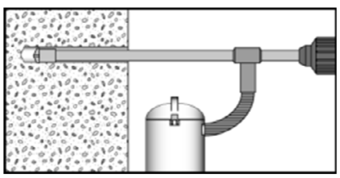
Drill the hole to the required embedment depth using a hammer drill with carbide drill bit set in rotation hammer mode.
Nominal drill hole diameter $\mathbf{d_0}$ (see **table B4.3)** and drill hole depth $\mathbf{h_0}$ (see **table A3.1**).

1b

Hammer drilling with hollow drill bit

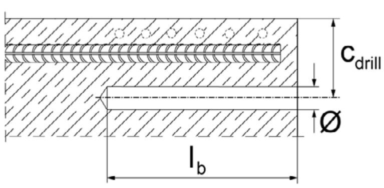


Check a suitable hollow drill (see **table B1.1**) for correct operation of the dust extraction.

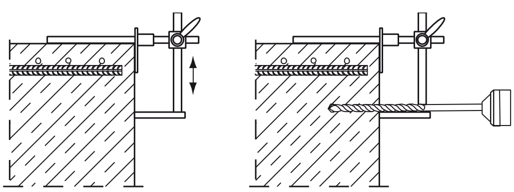


Drill the hole to the required embedment depth using a hammer drill with hollow drill bit in rotation hammer mode.
Dust extraction conditions see drill hole cleaning **Annex B 6**.
Nominal drill hole diameter $\mathbf{d_0}$ (see **table B4.3)** and drill hole depth $\mathbf{h_0}$ **(**see **table A3.1)**.

2



Measure and control concrete cover c
(c_{drill} = c + Ø / 2)
Drill parallel to surface edge and to existing rebar.
Where applicable use fischer drilling aid.



For holes l_b > 20 cm use drilling aid.
Three different options can be considered:

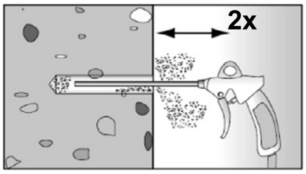
A) fischer drilling aid
B) Slat or spirit level
C) Visual check

Minimum concrete cover c_{min} see **table B3.1**.

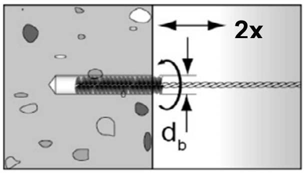
Installation instruction part 2

Drill hole cleaning (hammer drilling with standard drill bit)

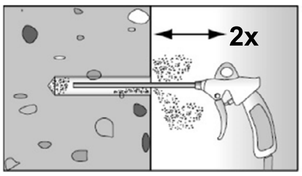
3a



Cleaning the drill hole.
Blow out the drill hole twice, with oil free compressed air (p ≥ 6 bar).
If the drill hole depth is greater than the length of the compressed-air cleaning tool, an extension and appropriate fischer cleaning nozzle must be used.
Corresponding diameters see **table B4.3.**



Brush the drill hole twice. For drill hole diameter ≥ 30 mm use a power drill.
For deep holes use an extension. Corresponding brushes see **table B4.3.**

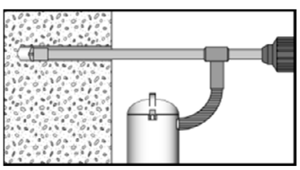


Cleaning the drill hole:
Blow out the drill hole twice, with oil free compressed air (p ≥ 6 bar).
If the drill hole depth is greater than the length of the compressed-air cleaning tool, an extension and appropriate fischer cleaning nozzle must be used.
Corresponding diameters see **table B4.3.**

Go to step 4

Drill hole cleaning (hammer drilling with hollow drill bit)

3b



Use a suitable dust extraction system, e. g.
fischer FVC 35 M or a comparable dust extraction system
with equivalent performance data.

Drill the hole with hollow drill bit. The dust extraction system has to extract the drill dust nonstop during the drilling process and must be adjusted to maximum power. Check the hollow drill for correct operation of the dust extraction.
No further cleaning steps necessary.

Go to step 4

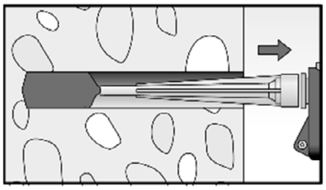
Installation instruction part 3
Reinforcing bars (rebar) and cartridge preparation

4		Before use, make asure that the rebar is dry and free of oil or other residue. Mark the embedment depth l_b (e.g. with tape) Insert rebar in borehole, to verify drill hole depth and setting depth l_b .
5		Twist off the sealing cap Twist on the static mixer (the spiral in the static mixer must be clearly visible).
6		Place the cartridge into a suitable dispenser.
7		Press out approximately 10 cm of mortar until the resin is permanently grey in colour. Mortar which is not grey in colour will not cure and must be disposed.

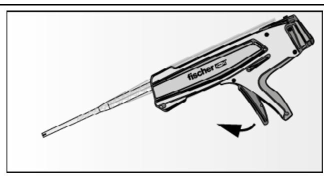
Go to step 8

Installation instruction part 4; Installation with FIS EM Plus
Injection of the mortar without extension tube

8a



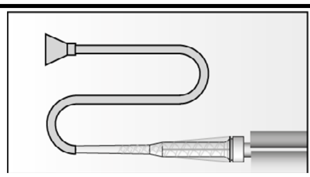
Inject the mortar from the back of the hole towards the front and slowly withdraw the static mixer step by step with each trigger pull.
Avoid bubbles.
Fill holes approximately 2/3 (for $h_0 = l_b$) full, to ensure that the annular gap between the rebar and the concrete will be completely filled with adhesive over the entire embedment length. For $h_0 > l_b$ more mortar is needed.
The conditions for mortar injection without extension tube can be found in **table B4.1**



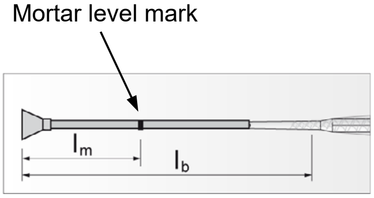
After injecting, release the dispenser. This will prevent further mortar discharge from the static mixer.

Injection of the mortar with extension tube

8b



Assemble mixing nozzle FIS MR Plus or FIS UMR, extension tube and appropriate injection adapter (see **table B4.3**).



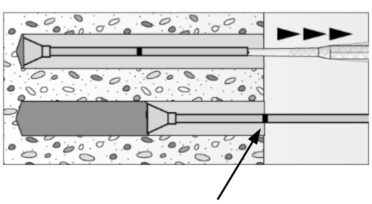
Mark the required mortar level l_m and embedment depth l_b with tape or marker on the injection extension tube.

a) Estimation:

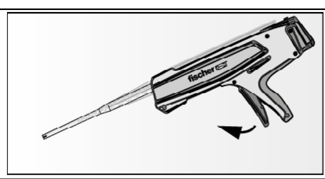
$$l_m = \frac{1}{3} \cdot l_b \text{ [mm]}$$

b) Precise equation for optimum mortar volume:

$$l_m = l_b \cdot \left((1{,}2 \cdot \frac{d_s^2}{d_0^2} - 0{,}2) \right) \text{ [mm]}$$



Insert injection adapter to back of the hole. Begin injection allowing the pressure of the injected adhesive mortar to push the injection adapter towards the front of the hole. Do not actively pull out!
Fill holes approximately 2/3 (for $h_0 = l_b$) full, to ensure that the annular gap between the rebar and the concrete will be completely filled with adhesive over the embedment length. For $h_0 > l_b$ more mortar is needed.
When using an injection adapter continue injection until the mortar level mark l_m becomes visible.
Maximum embedment depth, see **table B3.2.**



After injecting, release the dispenser. This will prevent further mortar discharge from the static mixer.

Go to step 9

Installation instruction part 5; Installation with FIS EM Plus
Insert rebar

9		Insert the rebar slowly twisted into the borehole until the embedment mark is reached. Recommendation: Rotation back and forth of the reinforcement bar makes pushing easy
10		After installing the rebar the annular gap must be completely filled with mortar. Proper installation • Desired embedment depth is reached l_b: embedment mark at concrete surface • Excess mortar flows out of the borehole after the rebar have been fully inserted up to the embedment mark.
11		For overhead installation, support the rebar and secure it from falling till mortar started to harden, e.g. using wedges.
12		Observe the working time "t_{work}" (see **table B4.2**), which varies according to temperature of base material. Minor adjustments to the rebar position may be performed during the working time Full load may be applied only after the curing time "t_{cure}" has elapsed (see **table B4.2**)

Influence of cracked concrete on combined pullout and concrete cone failure for working life of 100 years																				
Hammer-drilling with standard drill bit or hollow drill bit (dry or wet concrete)																				
Factor for influence of cracked concrete		$\Omega_{cr,03}$	[-]	0,91	0,91	0,91	0,91	0,91	0,91	0,92	0,92	0,92	0,92	0,92	0,92	0,92	0,93	0,93	0,93	0,93

[1)] **Calculation of characteristic bond resistance in uncracked concrete $\tau_{Rk,100,\ ucr}$:**

$\tau_{Rk,100,\ ucr} = \alpha_{100\ years} \cdot \tau_{Rk,ucr,50}$

Table C4.1: Characteristic resistance under tension loading for reinforcing bars (rebars) in concrete under seismic action; working life of 50 and 100 years

Nominal diameter of the bar		**ϕ**	**8**	**10**	**12**	**14**	**16**	**18**	**20**	**22**	**24**	**25**	**26**	**28**	**30**	**32**	**34**	**36**	**40**
Resistance to pull-out failure in uncracked concrete under cyclic loading for working life of 50 and 100 years																			
Hammer-drilling with standard drill bit or hollow drill bit (dry or wet concrete)																			
Reduction factor for pull-out Resistance under seismic action	$\alpha_{eq,p}$	[N/mm²]	0,76									1,0							
Influence of increased crack width on resistance to pull-out failure for working life of 50 and 100 years																			
Hammer-drilling with standard drill bit or hollow drill bit (dry or wet concrete)																			
Factor for influence of cracked concrete	$\Omega_{cr,05}$ 1)	[-]	0,86	0,86	0,86	0,86	0,86	0,86	0,86	0,86	0,86	0,86	0,86	0,86	0,87	0,87	0,87	0,87	0,87
	$\Omega_{cr,08}$ 1)		0,76	0,76	0,76	0,76	0,76	0,76	0,76	0,76	0,76	0,76	0,76	0,76	0,76	0,76	0,73	0,70	0,63
Resistance to bond-splitting failure under cyclic loading for working life of 50 and 100 years																			
Hammer-drilling with standard drill bit or hollow drill bit (dry or wet concrete)																			
Reduction factor for bond-splitting resistance under seismic action	$\alpha_{eq,sp}$	[-]	0,94																

1) Assumed crack width in accordance with EOTA Technical Report TR 069 June 2021; Section 3.6.
