

## PRESTANDADEKLARATION

### DoP 0304

för fischer injektionsystem FIS V (Mortel för efterinstallerade armeringsjärnanslutningar)

SV

1. Produktypens unika identifikationskod: **DoP 0304**
2. Avsedd användning/avsedda användningar: **System för efterinstallerad armeringsförbindelse med murbruk för användning i betong, Se bilaga, särskilt bilagor B1-B11.**
3. Tillverkare: **fischerwerke GmbH & Co. KG, Otto-Hahn-Straße 15, 79211 Denzlingen, Tyskland**
4. Tillverkarens representant: **-**
5. System för bedömning och fortlöpande kontroll av prestanda: **1**
6. Europeiskt bedömningsdokument: **EAD 330087-01-0601 Edition 06/2021**  
Europeisk teknisk bedömnning: **ETA-08/0266; 2022-05-12**  
Tekniskt bedömningsorgan: **DIBt- Deutsches Institut für Bautechnik**  
Anmält/anmälta organ: **2873 TU Darmstadt**

#### 7. Angiven prestanda:

##### **Mekanisk hållfasthet och stabilitet (BWR 1)**

###### **Karakteristiskt motstånd under statisk och kvasistatisch last:**

Bindkraft hos efterinstallerade armeringsjärn: Bilaga C1

$f_{bd,PIR,100y}$ = NPD

Minskningsfaktor: Bilaga C1

$k_{b,100y}$ = NPD

Förstärkningsfaktor för minsta förankringslängd: Bilaga C1

$\alpha_{lb,100y}$ = NPD

Karakteristiskt motstånd mot stålbrott hos armeringsjärn: Bilaga C2

###### **Karakteristiskt motstånd under seismisk last:**

Vidhäftning vid seismisk last, Seismisk vidhäftningsfaktor: NPD

Minsta betongskikt vid seismisk last: NPD

##### **Säkerhet vid brand (BWR 2)**

Reaktion vid brand: Klass (A1)

###### **Motståndskraft mot eld:**

Vidhäftning vid ökad temperatur vid efter-injekterad armering bedömd till 50 år: Bilaga C3

Vidhäftning vid ökad temperatur vid efter-injekterad armering bedömd till 100 år: NPD

Karakteristiskt motstånd mot stålbrott hos armeringsjärn under brandexponering: Bilaga C2

8. Lämplig teknisk dokumentation och/eller särskild teknisk dokumentation: **-**

Prestandan för ovanstående produkt överensstämmer med den angivna prestandan. Denna prestandadeklaration har utfärdats i enlighet med förordning (EU) nr 305/2011 på eget ansvar av den tillverkare som anges ovan.

Undertecknad på tillverkarens vägnar av:

Dr.-Ing. Oliver Geibig, Verkställande direktör affärsheter och teknik  
Tumlingen, 2022-05-30

Jürgen Grün, Verkställande direktör kemi och kvalitet

Denna DoP har förberetts på olika språk. I händelse av tvist om tolkningen ska den engelska versionen alltid råda.

Bilagan innehåller frivilliga och kompletterande information på engelska som överskrider (det specifika språkets) lagkrav.

## **Specific Part**

### **1 Technical description of the product**

The subject of this European Technical Assessment is the post-installed connection, by anchoring or overlap connection joint, of reinforcing bars (rebars) in existing structures made of normal weight concrete, using the "Rebar connection with injection system FIS V" in accordance with the regulations for reinforced concrete construction.

Reinforcing bars with a diameter  $\phi$  from 8 to 28 mm or the fischer rebar anchor FRA of sizes M12 to M24 according to Annex A and the fischer injection mortar FIS V or FIS VS Low Speed are used for the post-installed rebar connection. The steel element is placed into a drilled hole filled with injection mortar and is anchored via the bond between embedded reinforcing bar, injection mortar and concrete.

The product description is given in Annex A.

### **2 Specification of the intended use in accordance with the applicable European assessment Document**

The performances given in Section 3 are only valid if the rebar connection is used in compliance with the specifications and conditions given in Annex B.

The verifications and assessment methods on which this European Technical Assessment is based lead to the assumption of a working life of the rebar connection of at least 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

### **3 Performance of the product and references to the methods used for its assessment**

#### **3.1 Mechanical resistance and stability (BWR 1)**

<b>Essential characteristic</b>	<b>Performance</b>
Characteristic resistance under static and quasi-static loading	See Annex C 1
Characteristic resistance under seismic loading	No performance assessed

#### **3.2 Safety in case of fire (BWR 2)**

<b>Essential characteristic</b>	<b>Performance</b>
Reaction to fire	Class A1
Resistance to fire	See Annex C 2 and C 3

### **4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base**

In accordance with European Assessment Document EAD No. 330087-01-0601, the applicable European legal act is: [96/582/EC].

The system(s) to be applied is (are): 1

# Installation conditions and application examples fischer rebar anchor FRA

**Figure A3.1:**

Lap to a foundation of a column under bending.

1. Shear lug (or fastener loaded in shear)
2. fischer rebar anchor FRA (tension only)
3. Existing stirrup / reinforcement for overlap (lap splice)
4. Slotted hole

**Figure A3.2:**

Lap of the anchoring of guardrail posts or anchoring of cantilevered building components.

In the anchor plate, the drill holes for the fischer rebar anchors have to be designed as slotted holes with axial direction to the shear force.

1. Fastener for shear load transfer
2. fischer rebar anchor FRA (tension only)
3. Existing stirrup / reinforcement for overlap (lap splice)
4. Slotted hole

The required transverse reinforcement acc. to EN 1992-1-1:2004+AC:2010 is not shown in the figures. **The fischer rebar anchor FRA may be only used for axial tensile force.** The tensile force must be transferred by lap to the existing reinforcement of the building. The transfer of the shear force has to be ensured by suitable measure, e.g. by means of shear force or anchors with European Technical Assessment (ETA)

## Properties of reinforcing bars (rebar)

Figure A5.1:

- The minimum value of related rip area  $f_{R,min}$  according to EN 1992-1-1:2004+AC:2010
- The maximum outer rebar diameter over the rips shall be:
  - The nominal diameter of the rip  $\phi + 2 * h$  ( $h \leq 0,07 * \phi$ )
  - ( $\phi$ : Nominal diameter of the bar;  $h_{rib}$  = rip height of the bar)

Table A5.1: Installation conditions for rebars

Nominal diameter of the bar	$\phi$	8 <sup>1)</sup>	10 <sup>1)</sup>	12 <sup>1)</sup>	14	16	20	25 <sup>1)</sup>	28
Nominal drill hole diameter	$d_0$ [mm]	10	12	12	14	14	16	18	20
Drill hole depth								$h_0 = l_v$	25
Effective embedment depth								acc. to static calculation	30
Minimum thickness of concrete member				$l_v + 30$ ( $\geq 100$ )				$l_v + 2d_0$	35

<sup>1)</sup> Both drill hole diameters can be used

## Specifications of intended use part 2

### Anchorage subject to:

- Static and quasi-static loading: reinforcing bar (rebar) size 8 mm to 28 mm
- Resistance to fire

### Base materials:

- Compacted reinforced or unreinforced normal weight concrete without fibres according to EN 206:2013+A1:2016
- Strength classes C12/15 to C50/60 according to EN 206:2013+A1:2016
- Maximum chloride content of 0,40 % (CL 0.40) related to the cement content according to EN 206:2013+A1:2016
- Non-carbonated concrete

Note: In case of a carbonated surface of the existing concrete structure the carbonated layer shall be removed in the area of the post-installed rebar connection with a diameter of  $\phi + 60$  mm prior to the installation of the new rebar. The depth of concrete to be removed shall correspond to at least the minimum concrete cover in accordance with EN 1992-1-1 :2004+AC:2010. The foregoing may be neglected if building components are new and not carbonated and if building components are in dry conditions.

### Use conditions (Environmental conditions) for fischer rebar anchors FRA

- For all conditions according to EN1993-1-4:2006+A1:2015 corresponding to corrosion resistance classes to Annex A 6 table A6.2.

### Design:

- Fastenings are designed under the responsibility of an engineer experienced in fastenings and concrete work.
- Verifiable calculation notes and drawings are prepared taking account of the forces to be transmitted.
- Design according to EN 1992-1-1:2004+AC:2010; EN 1992-1-2:2004+AC:2008 and Annex B 3 and B 4.
- The actual position of the reinforcement in the existing structure shall be determined on the basis of the construction documentation and taken into account when designing.

### Installation:

- The installation of post-installed rebar respectively fischer rebar anchor FRA shall be done only by suitable trained installer and under Supervision on site; the conditions under which an installer may be considered as suitable trained and the conditions for Supervision on site are up to the Member States in which the installation is done.
- Check the position of the existing rebars (if the position of existing rebars is not known, it shall be determined using a rebar detector suitable for this purpose as well as on the basis of the construction documentation and then marked on the building component for the overlap joint).

Appendix 9 / 21

## General construction rules for post-installed rebars

**Figure B3.1:**

- Only tension forces in the axis of the rebar may be transmitted.
- The transfer of shear forces between new concrete and existing structure shall be designed additionally according to EN 1992-1-1:2004+AC:2010.
- The joints for concreting must be roughened to at least such an extent that aggregate protrude.

<sup>1)</sup> If the clear distance between lapped bars exceeds  $4\phi$  then the lap length shall be increased by the difference between the clear bar distance and  $4\phi$

c	concrete cover of post-installed rebar
$c_1$	concrete cover at end-face of existing rebar
$c_{min}$	minimum concrete cover according to table B5.1 and to EN 1992-1-1:2004+AC:2010, Section 4.4.1.2
$\phi$	nominal diameter of reinforcing bar
$l_0$	lap length, according to EN 1992-1-1:2004+AC:2010
$l_v$	effective embedment depth, $\geq l_0 + c_1$
$d_0$	nominal drill bit diameter, see Annex B 6

**Intended use**  
General construction rules for post-installed rebars

**Annex B 3**

## General construction rules for post-installed fischer rebar anchors FRA

**Figure B4.1:**

- Only tension forces in the axis of the fischer rebar anchor FRA may be transmitted.
- The tension force must be transferred via an overlap joint to the reinforcement in the building part.
- The transmission of the shear load shall be ensured by appropriate additional measures, e.g. by shear lugs or by anchors with a European Technical Assessment (ETA).
- In the anchor plate, the holes for the tension anchor shall be executed as slotted holes with the axis in the direction of the shear force.

<sup>1)</sup> If the clear distance between lapped bars exceeds  $4 \phi$  then the lap length shall be increased by the difference between the clear bar distance and  $4 \phi$ .

c	concrete cover of post-installed fischer rebar anchor FRA
$c_1$	concrete cover at end-face of existing rebar

## Safety regulations

Review the Safety Data Sheet (SDS) before use for proper and safe handling!  
Wear well-fitting protective goggles and protective gloves when working with mortar FIS V / FIS VS Low Speed.  
Important: Observe the instructions for use provided with each cartridge.

## Installation instruction part 1; Installation with FIS V / FIS VS Low Speed

### Hole drilling

Note: Before drilling, remove carbonized concrete; clean contact areas (see Annex B 2)  
In case of aborted drill holes the drill hole shall be filled with mortar.

#### Hammer drilling or compressed air drilling

1a

Drill the hole to the required embedment depth using a hammer drill with carbide drill bit set in rotation hammer mode or a pneumatic drill.  
Drill bit sizes see table B6.2.

1b

Drill the hole to the required embedment depth using a hammer drill with hollow drill bit in rotation hammer mode.  
Dust extraction conditions see drill hole cleaning annex B 8.  
Drill bit sizes see table B6.2.

2

Measure and control concrete cover  $c$   
( $c_{drill} = c + \frac{\emptyset}{2}$ )  
Drill parallel to surface edge and to existing rebar.  
Where applicable use drilling aid.

For holes  $l_v > 20$  cm use drilling aid.  
Three different options can be considered:  
A) drilling aid  
B) Slat or spirit level  
C) Visual check

Minimum concrete cover  $c_{min}$  see table B5.1

### Rebar connection with injection system FIS V

#### Intended use

Safety regulations; Installation instruction part 1, hole drilling

#### Annex B 7

Appendix 14 / 21

## Installation instruction part 2; Installation with FIS V / FIS VS Low Speed

### Drill hole cleaning

	<b>Hammer or compressed air drilling</b> 	
	<b>Blowing</b> three times from the back of the hole with the appropriate nozzle (oil-free compressed air $\geq 6$ bar) until return air stream is free of noticeable dust. Personal protective equipment must be used (see regulations Annex B 7).	
3a		<b>Brushing (with power drill)</b> three times with the suitable brush size (brush diameter $>$ drill hole diameter). Switch on the power drill after inserting the steel brush into the drill hole. The brush must produce a noticeable resistance when it is inserted into the drill hole. If this is not the case, use a new or larger brush. If necessary, check with brush inspection template. Suitable brushes see table B6.2.
		<b>Blowing</b> three times from the back of the hole with the appropriate nozzle (oil-free compressed air $\geq 6$ bar) until return air stream is free of noticeable dust. Personal protective equipment must be used. (see regulations Annex B 7).
3b	<b>Hammer drilling with hollow drill bit</b> 	 Use a suitable dust extraction system, e. g. fischer FVC 35 M or a comparable dust extraction system with equivalent performance data. Drill the hole with hollow drill bit. The dust extraction system has to extract the drill dust nonstop during the drilling process and must be adjusted to maximum power. No further drill hole cleaning necessary
<b>Rebar connection with injection system FIS V</b>		<b>Annex B 8</b> Appendix 15 / 21
<b>Intended use</b> Installation instruction part 2, drill hole cleaning		

## Installation instruction part 3; Installation with FIS V / FIS VS Low Speed

### reinforcing bars (rebar) / fischer rebar anchor FRA and cartridge preparation

4		<p>Before use, make sure that the rebar or the fischer rebar anchor FRA is dry and free of oil or other residue. Mark the embedment depth <math>l_v</math> (e.g. with tape) Insert rebar in borehole, to verify drill hole depth and setting depth <math>l_v</math> resp. <math>l_{e,ges}</math></p>
5		<p>Twist off the sealing cap Twist on the static mixer (the spiral in the static mixer must be clearly visible).</p>
6		<p>Place the cartridge into a suitable dispenser.</p>
7		<p>Press out approximately 10 cm of mortar until the resin is permanently grey in colour. Mortar which is not grey in colour will not cure and must be disposed.</p>

### Rebar connection with injection system FIS V

#### Intended use

Installation instruction part 3,  
reinforcing bars (rebar) / fischer rebar anchor and cartridge preparation

#### Annex B 9

Appendix 16 / 21

## Installation instruction part 4; Installation with FIS V / FIS VS Low Speed

### Injection of the mortar; borehole depth $\leq 250$ mm

8a

Inject the mortar from the back of the hole towards the front and slowly withdraw the mixing nozzle step by step with each trigger pull.

Avoid bubbles.

Fill holes approximately 2/3 full, to ensure that the annular gap between the rebar and the concrete will be completely filled with adhesive over the entire embedment length.

After injecting, release the dispenser. This will prevent further mortar discharge from the static mixer.

### Injection of the mortar; borehole depth $> 250$ mm

8b

Assemble static mixer, extension tube and appropriate injection adapter (see table B6.2)

Mortar level mark

Mark the required mortar level  $l_m$  and embedment depth  $l_v$  resp.  $l_{e,ges}$  with tape or marker on the injection extension tube.

a) Estimation:

$$l_m = \frac{1}{3} * l_v \text{ resp. } l_m = \frac{1}{3} * l_{e,ges} [\text{mm}]$$

b) Precise equation for optimum mortar volume:

$$l_m = l_v \text{ resp. } l_{e,ges} \left( (1,2 * \frac{d_s^2}{d_0^2} - 0,2) \right) [\text{mm}]$$

Mortar level mark

Insert injection adapter to back of the hole. Begin injection allowing the pressure of the injected adhesive mortar to push the injection adapter towards the front of the hole. Do not actively pull out!

Fill holes approximately 2/3 full, to ensure that the annular gap between the rebar and the concrete will be completely filled with adhesive over the embedment length.

When using an injection adapter continue injection until the mortar level mark  $l_m$  becomes visible.

Maximum embedment depth see table B5.2

After injecting, release the dispenser. This will prevent further mortar discharge from static mixer.

#### Intended use

Installation instruction part 4, mortar injection

#### Annex B 10

Appendix 17 / 21

## Installation instruction part 5; Installation with FIS V / FIS VS Low Speed

### Insert rebar / fischer rebar anchor FRA

9		<p>Insert the rebar / fischer rebar anchor FRA / FRA HCR slowly twisted into the borehole until the embedment mark is reached. Recommendation: Rotation back and forth of the reinforcement bar or the fischer rebar anchor FRA makes pushing easy</p>
10		<p>For overhead installation, support the rebar / fischer rebar anchor FRA and secure it from falling till mortar started to harden, e.g. using wedges.</p>
11		<p>After installing the rebar or fischer rebar anchor FRA the annular gap must be completely filled with mortar.</p> <p>Proper installation</p> <ul style="list-style-type: none"><li>Desired embedment depth is reached <math>l_v</math>: embedment mark at concrete surface</li><li>Excess mortar flows out of the borehole after the rebar has been fully inserted up to the embedment mark.</li></ul>
12		<p>Observe the working time "<math>t_{work}</math>" (see table B6.1), which varies according to temperature of base material. Minor adjustments to the rebar / fischer rebar anchor FRA position may be performed during the working time</p> <p>Full load may be applied only after the curing time "<math>t_{cure}</math>" has elapsed (see table B 6.1)</p>
13		<p>Mounting the fixture, max <math>T_{inst}</math> see table A6.1</p>

### Rebar connection with injection system FIS V

#### Intended use

Installation instruction part 5, insert rebar / fischer rebar anchor

#### Annex B 11

Appendix 18 / 21

## Minimum anchorage length and minimum lap length

The minimum anchorage length  $l_{b,min}$  and the minimum lap length  $l_{o,min}$  according to EN 1992-1-1:2004+AC:2010 shall be multiply by the relevant amplification factor  $\alpha_{lb}$  according to table C1.1.

**Table C1.1:** Amplification factor  $\alpha_{lb}$  related to concrete strength class and drilling method

Concrete strength class	Drilling method	Amplification factor $\alpha_{lb}$
C12/15 to C50/60	Hammer drilling with standard drill bit	1,0
	Hammer drilling with hollow drill bit (fischer "FHD", Heller "Duster Expert", Bosch "Speed Clean", Hilti "TE-CD, TE-YD")	1,0
	Compressed air drilling	1,0

**Table C1.2:** Bond efficiency factor  $k_b$  for hammer drilling, hollow drilling and compressed air drilling

### Hammer drilling, hollow drilling and compressed air drilling

Rebar / fischer rebar anchor $\phi$ [mm]	Bond efficiency factor $k_b$								
	Concrete strength class								
	C12/15	C16/20	C20/25	C25/30	C30/37	C35/45	C40/50	C45/55	C50/60
8 to 28	1,00								

**Table C1.3:** Design values of the bond strength  $f_{bd,PIR}$  in N/mm<sup>2</sup> for hammer drilling, hollow drilling, compressed air drilling and for good bond conditions

$$f_{bd,PIR} = k_b \cdot f_{bd}$$

$f_{bd}$ : Design value of the bond strength in N/mm<sup>2</sup> considering the concrete strength classes and the rebar diameter for good bond condition (for all other bond conditions multiply the values by  $\eta_1 = 0,7$ ) and recommended partial factor  $\gamma_c = 1,5$  according to EN 1992-1-1: 2004+AC:2010

$k_b$ : Bond efficiency factor according to table C1.2

### Hammer drilling, hollow drilling and compressed air drilling

Rebar / fischer rebar anchor FRA $\phi$ [mm]	bond strength $f_{bd,PIR}$ [N/mm <sup>2</sup> ]								
	Concrete strength class

##### Performance

Characteristic tensile yield strength for rebar part of FRA; Design value of the steel bearing capacity N<sub>Rk,s,fi</sub> under fire exposure for fischer rebar anchor

##### Annex C 2

## Design value of the ultimate bond strength $f_{bd,fi}$ at increased temperature for concrete strength classes C12/15 to C50/60 (all drilling methods)

The design value of the bond strength  $f_{bd,fi}$  at increased temperature has to be calculated by the following equation:

$$f_{bd,fi} = k_{fi}(\theta) \cdot f_{bd,PIR} \cdot \frac{\gamma_c}{\gamma_{m,fi}}$$

If:  $\theta > 74 \text{ } ^\circ\text{C}$        $k_{fi}(\theta) = \frac{24,308 \cdot e^{-0,012 \cdot \theta}}{f_{bd,PIR} \cdot 4,3} \leq 1,0$

If:  $\theta > \theta_{\max} (317 \text{ } ^\circ\text{C})$        $k_{fi}(\theta) = 0$

$f_{bd,fi}$  = Design value of the ultimate bond strength at increased temperature in N/mm<sup>2</sup>

( $\theta$ ) = Temperature in °C in the mortar layer

$k_{fi}(\theta)$  = Reduction factor at increased temperature

$f_{bd,PIR}$  = Design value of the bond strength in N/mm<sup>2</sup> in cold condition according to table C1.3 considering the concrete strength classes, the rebar diameter, the drilling method and the bond conditions according to EN 1992-1-1:2004+AC:2010

$\gamma_c$  = 1,5 recommended partial factor according to EN 1992-1-1:2004+AC:2010

$\gamma_{m,fi}$  = 1,0 recommended partial factor

For evidence at increased temperature the anchorage length shall be calculated according to EN 1992-1-1:2004+AC:2010 Equation 8.3 using the temperature-dependent ultimate design value of bond strength  $f_{bd,fi}$ .

**Figure C3.1:** Example graph of reduction factor  $k_{fi}(\theta)$  for concrete class C20/25 for good bond conditions
