## 1 Objective and request

In the letter dated 14 June 2018, fischerwerke GmbH & Co. KG commissioned MFPA Leipzig GmbH with an advisory opinion on the reaction to fire behaviour of the fischer FIS EB injection system in combination with the fischer anchor rod FIS A and reinforcing bars, in each case positioned vertically to the surface of panels and walls which is exposed to fire from one side.

## 2 Principles and documents for the advisory opinion

The following principles and documents were used for the advisory opinion:

- [1] Technical Report TR 020 "Evaluation of Anchorages in Concrete concerning Resistance to Fire" (May 2004) of the European Organisation for Technical Approvals (EOTA),
- [2] European Technical Approval ETA-15/0440 by DIBt Berlin dated 13/12/2017: "fischer injection system FIS EB", bonded fastener for use in concrete,
- [3] Kordina, K.; Meyer-Ottens, C.: Concrete Fire Protection guide, publisher Construction and Technology, 1999,
- [4] Test report PB 3.2/10-245-1 from 17/05/2011 by MFPA Leipzig,
- [5] Advisory opinion dated 07/12/2010 by MFPA Leipzig GmbH,
- [6] Work report for the period 1978 – 1980 by Ruge, J. und Winkelmann, O. on the Collaborative Research Centre 148 - Fire behaviour of components - Subproject B4 - Deformation of structural, concrete and prestressing steels at high temperatures,
- [7] DIN EN 13381-3:2015-06 – Test methods for determining the contribution to the fire resistance of structural members - Part 3: Applied protection to concrete members,
- [8] DIN EN 206:2014-07 Concrete – Specification, performance, production and conformity
- [9] DIN EN 1992-1-2:2010-12 Design of concrete structures - Part 1-2: General rules - Structural fire design,
- [10] Test report PB 3.2/18-020-1 from 19/03/2018 by MFPA Leipzig,
- [11] GS 3.2/13-104-1 Ä from 13/03/2014 by MFPA Leipzig GmbH,

Apart from these documents, the extensive testing experience of MFPA Leipzig with respect to the fire behaviour of fastenings and of reinforced concrete constructions is incorporated in the fire protection assessment.

In accordance with [7], temperature curves were taken as a basis for the advisory opinion, in particular for the heating behaviour of reinforced concrete elements made of normal concrete with quartzite aggregates. Figure 1 shows the heating depths for parts with unilateral exposure to fire.

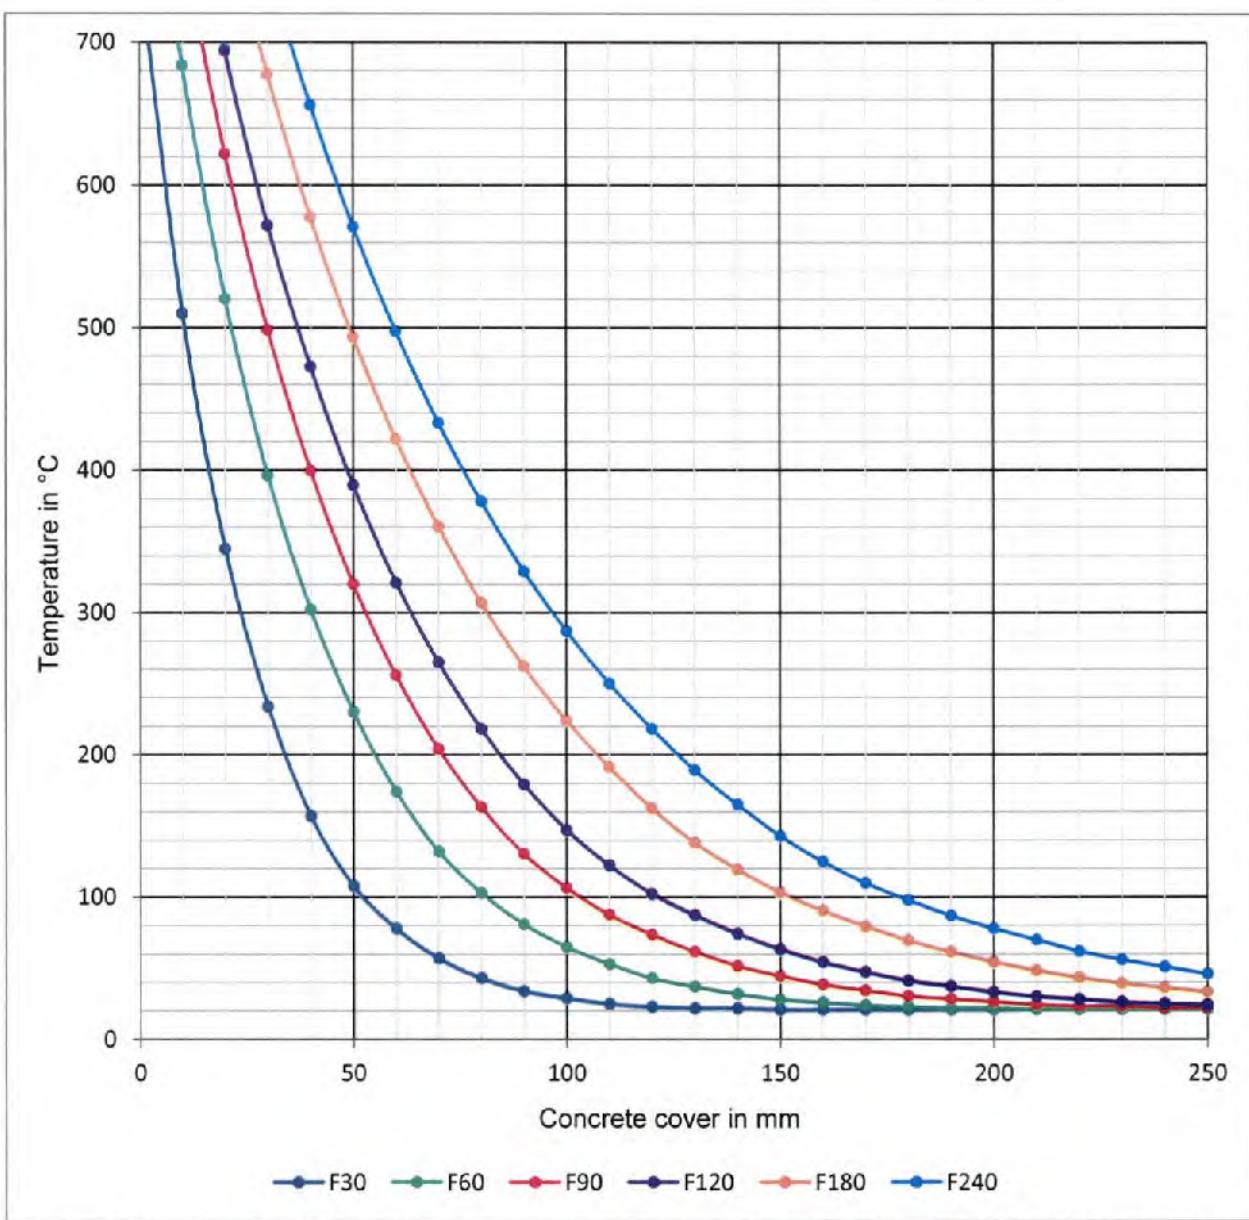

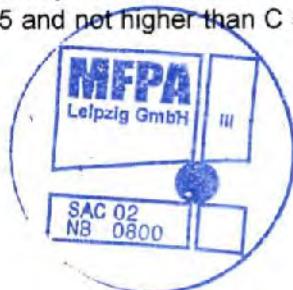

Fig. 1: Temperatures in reinforced concrete structural components after 30, 60, 90, 120, 180 and 240 minutes exposure to fire on one side in accordance with EN 1363-1, data from [7]

### 3 Description of the tested structure

The fischer FIS EB injection system (according to [2]) is a bonded anchor which consists of a mortar cartridge with injection mortar fischer FIS EB and a steel component. The steel component consists of a fischer anchor rod FIS A in sizes M8 to M30 or a reinforcing bar with a diameter between 8 mm and 40 mm. The steel component is inserted in a bore hole filled with injection mortar and anchored by the bond between the steel component, the injection mortar and the concrete. Details on the installation can be found in ETA 15/0440 [2]. Under predominantly static and quasi-static load, the dowel may be anchored in reinforced and unreinforced standard concrete of a stability class of at least C 20/25 and not higher than C 50/60 in accordance with DIN EN 206:2014-07 [8].

## 4 Fire protection assessment concept

The characteristic values for the resistance in the event of a fire are determined for the failure type "pulling out of the concrete"  $N_{Rk,p,fi(t)}$  and "steel failure"  $N_{Rk,s,fi(t)}$ . They are based on the test results at increased temperatures for steel failure (see test reports [4] and [10]) and shear failure of the bonded surface (see advisory opinion [5] and [11]).

### 4.1 Anchorage of fischer anchor rod FIS A with the fischer FIS EB injection system

The characteristic tension resistance for the steel failure of various thread diameters under central tension is listed in table 1 as a function of the determined fire-resistance period. Deviating from TR 020, the values were increased for a fire-resistance period of 30 minutes depending on the available test results. The increased R 30 values for steel failure are based on the mean value of the values from the rating line and rating curve. The averaged values are on the safe side and have been confirmed by available test results with longer fire-resistance periods.

Table 1: Characteristic tension resistance  $N_{Rk,s,fi(t)}$  in kN for the steel failure of the FIS EB injection system, determined for steel 5.8, data from [4]

FIS EB		M8	M10	M12	M14	M16	M20	M22	M24	M27	M30
30 min	$N_{Rk,s,fi(30)}$	2.2	3.6	5.5	7.8	11.3	17.6	21.8	25.4	33.0	40.4
60 min	$N_{Rk,s,fi(60)}$	1.2	2.0	3.2	4.6	6.9	10.8	13.3	15.5	20.2	24.7
90 min	$N_{Rk,s,fi(90)}$	0.7	1.2	2.0	3.0	4.7	7.4	9.1	10.6	13.8	16.9
120 min	$N_{Rk,s,fi(120)}$	0.5	0.9	1.4	2.2	3.6	5.6	7.0	8.2	10.6	13.0
180 min	$N_{Rk,s,fi(180)}$	0.2	0.5	0.9	1.5	2.5	3.9	4.9	5.7	7.4	9.1
240 min	$N_{Rk,s,fi(240)}$	0.1	0.3	0.6	1.1	2.0	3.1	3.8	4.5	5.8	7.1

The characteristic resistance of the anchorage against pulling out of concrete is determined by equations

$$N_{Rk,p,fi(t)} = h_{ef} \cdot d \cdot \pi \cdot \tau_{Rk,p,fi(t)}$$

with the effective anchoring depth  $h_{ef}$ , the thread diameter  $d$  and the shear resistance  $\tau_{Rk,p,fi(t)}$ . The shear resistance has to be determined as a function of the concrete temperature. To achieve this, the shear failure of the bonded surface (see advisory opinion [5]) is analysed as a function of the failure temperature (see figure 2).

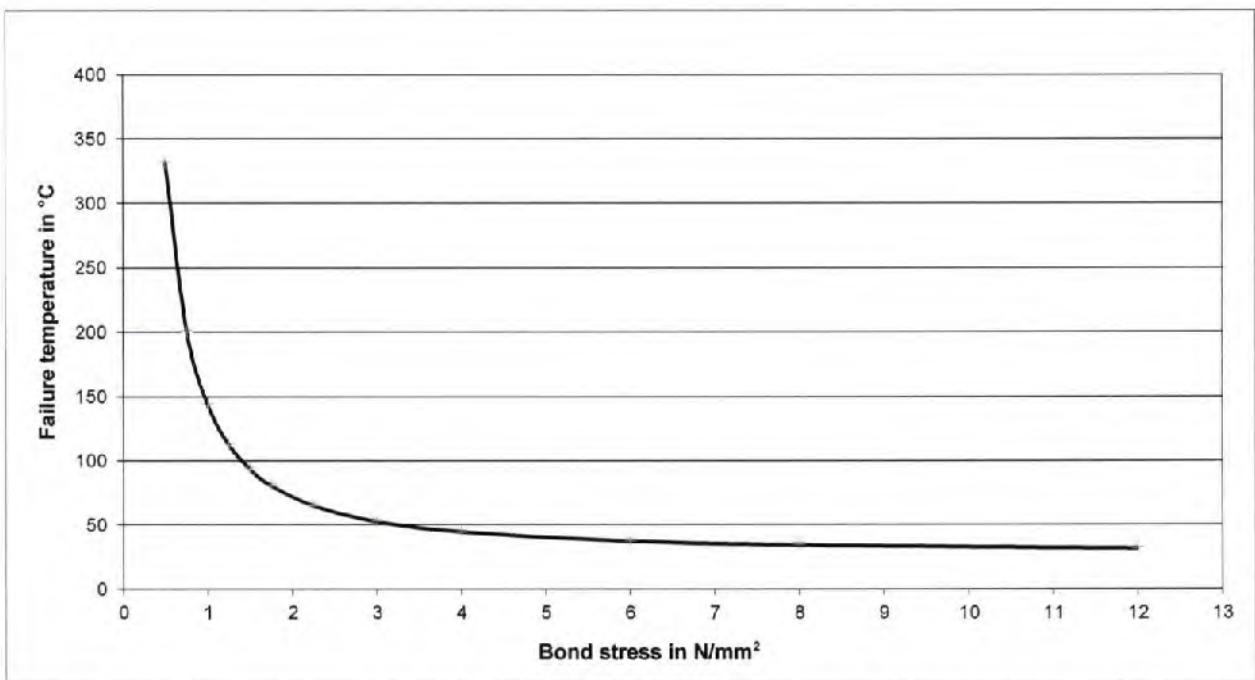

Fig. 2: Graphical representation of the rating curve of the failure temperature as a function of the bond stress of the fischer FIS EB injection system

This means that the shear resistance can be specified based on the identified approximation function

$$\tau_{Rk,p,fi}(\theta) = (0,008696 \cdot \theta_{c,d} - 0,243)^{-0,714}$$

as a function of the concrete temperature  $\theta_{c,d}$ . This value is, however, limited to 9 N/mm<sup>2</sup> by the characteristic bond strengths for anchor rods size M 30 which are specified in the approval [2].

Since the temperature of the shear plane in the concrete varies with the depth of the hole, the characteristic values for the resistance in the case of fire for the failure type "pulling out of the concrete"  $N_{Rk,p,fi(t)}$  are determined through the integration of the critical, temperature-dependent bond stresses  $\tau_{Rk,p,fi(t)}$  (multiplied by the bonded surface) as a function of the anchoring depth  $h_{ref}$ .

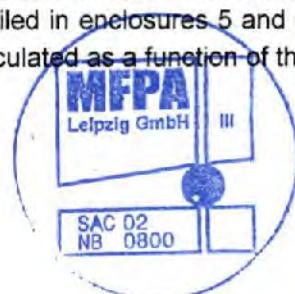

The characteristic values of the failure types "steel failure" and "pulling out of the mortar" are to be calculated depending on the variable anchoring depths. The FIS EB injection system was designed according to TR 020, equation 2.1. The partial safety factor of the resistances under exposure to fire is  $\gamma_{M,fi} = 1.0$ .

The smaller resistance

$$N_{Rd,fi(t)} = \min(N_{Rk,p,fi(t)}, N_{Rk,s,fi(t)})$$

of the two possible failure cases "steel tension failure" and "pulling out of the concrete" is to be used for the assessment.

The calculation concept applies to fischer anchor rod FIS A, ø M8 to ø M30, to fire-resistance periods between 30 minutes and 240 minutes. The determination of the characteristic values for the failure types "pulling out of the concrete"  $N_{Rk,p,fi(t)}$  and "steel failure"  $N_{Rk,s,fi(t)}$  is compiled in enclosures 5 and 6. The characteristic values of the failure types "concrete break-out" are to be calculated as a function of the variable anchoring depth using the equations 2.11 and 2.12 acc. to TR 020.

## 4.2 Reinforcing connection using the fischer FIS EB injection system

### Verification of reinforcing steel used as an anchor

The characteristic values for the resistance in the event of a fire for the failure type "pulling out of concrete"  $N_{RK,p,fi(t)}$  were also determined for reinforcing steel used as an anchor through the integration of the critical temperature-dependent bond stresses as a function of the anchoring depth  $h_{ef}$  of the reinforcing bar and the duration of heating. Figure 3 explains the principle of function for the application as an anchor. The anchorage zone of the reinforcement is located vertical to the surface of the element exposed to fire and lies in different temperature areas.

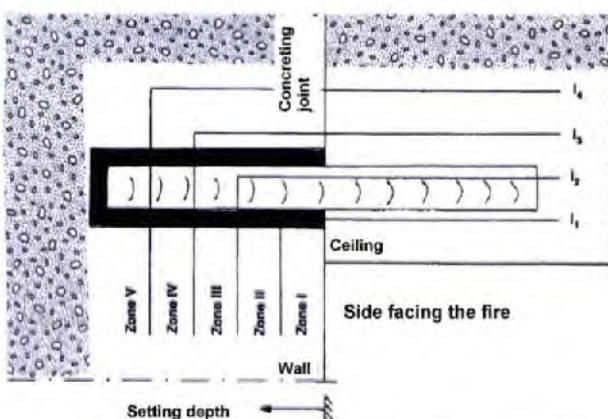

Figure 3: Schematic diagram of the reinforcement connection variant "anchorage"

The assessment concept applies for reinforcing steel variants with limits of elasticity from 400 to 500 MPa, for bars with a nominal diameter of  $\varnothing$  8 mm to  $\varnothing$  40 mm and for fire-resistance periods of 30 minutes to 240 minutes. The partial safety factor for the resistances under exposure to fire was set to  $\gamma_{fi} = 1.0$ .

The characteristic values against pulling out are compiled in enclosure 1 for BSt 400, in enclosure 2 for BSt 420, in enclosure 3 for BSt 460 and in enclosure 4 for BSt 500. The characteristic values for the resistance for the fire case for the failure type "steel failure" limit the values for the failure type "pulling out" and are shown with a grey background. Interim values may be interpolated. An extrapolation is not allowed. The quoted loads apply for the stress directions central tension, shear tension and diagonal tension at every angle.

The failure types "steel failure" and "concrete break-out" were not taken into account in this assessment. The connected structural element must display the same fire resistance as the anchor application.

## 5 Special notes

The above evaluation only applies to the fischer FIS EB injection system which was installed in compliance with the installation instructions of fischerwerke GmbH & Co. KG or a general building authority approval or European Technical Assessment.

The test results can be transferred to stainless steel A4 and highly corrosion-resistant stainless steel (see approval [2]) with at least the same anchoring depth.

The assessment applies in general to a one-sided fire exposure of the structural elements. In the event of exposure to fire from several sides, the verification procedure can only be applied if the distance of the anchor to the outer edge is  $c \geq 300$  mm and  $\geq 2 h_{ef}$ .

Based on this, the specified loads also apply to shear tension and/or diagonal tension.

The assessment only applies in conjunction with reinforced concrete ceilings of strength class  $\geq C 20/25$  and  $\leq C 50/60$  acc. to DIN EN 206:2014-07 [8] that have at least the same fire resistance rating as the fire-resistance period of the anchors.

In addition, the notes contained in DIN EN 1992-1-2:2010-12 [9] (see section 4.5) on the avoidance of concrete spalling apply. This means that the moisture content must be less than three percent by weight (or four percent according to the National Annex).

This document does not replace any certificate of conformity or usability as defined by the building regulations (national/European).
