

**Dynamic  
fixing solutions.**

# Dynamic loads and their applications.

Dynamic loads are also called non-static loads, and are involved in particular in mechanical engineering, and more and more often in construction. There are assumed to be a very large number of load changes (switching between loading and unloading, changes in the loading direction or changes in the load height) over the service life of the component. These load changes occur at anchorages with

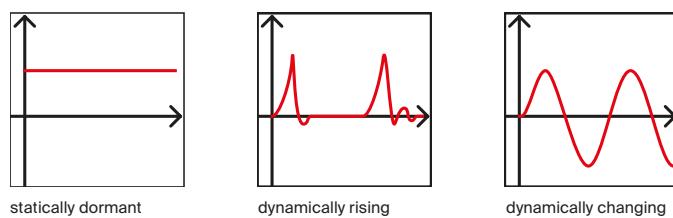

plugs, for instance on robots, cranes, and elevators. However, they also occur on trains passing by noise protection walls or trucks in road tunnels, which generate dynamic loads on installations due to the constant interchange between pressure and suction caused by airflow.

## Types of loads: Repeated load cycle, alternating load, static load.

Repeated load cycles occur, for instance, due to the tilting moment of slewing pillar cranes, which move by rotating on their axes, depending on the crane position, with a suspended load between the "0" state (pressure, and therefore no load on the plugs) and the maximum tensile load value on the plugs. Alternating loads may act on a plug group used to fix a crane rail in the longitudinal direction, for instance, through braking and acceleration forces. Effects caused by earthquakes are not relevant to fatigue, and should therefore be considered separately. Wind loads are primarily considered static loads according to the Eurocode. While the load fluctuates between "0" and the positive maximum tensile load for a dynamic repeated load cycle on plug anchorages, the mathematical sign changes in case of a dynamic repeated load cycle, which describes an acting lateral load. The load relevant

for the calculation, therefore, is determined from the values for the positive and negative maximum, for example with a positive and negative extreme value of 5 as " $|l-5| + |l+5| = 10 \text{ kN}$ ".

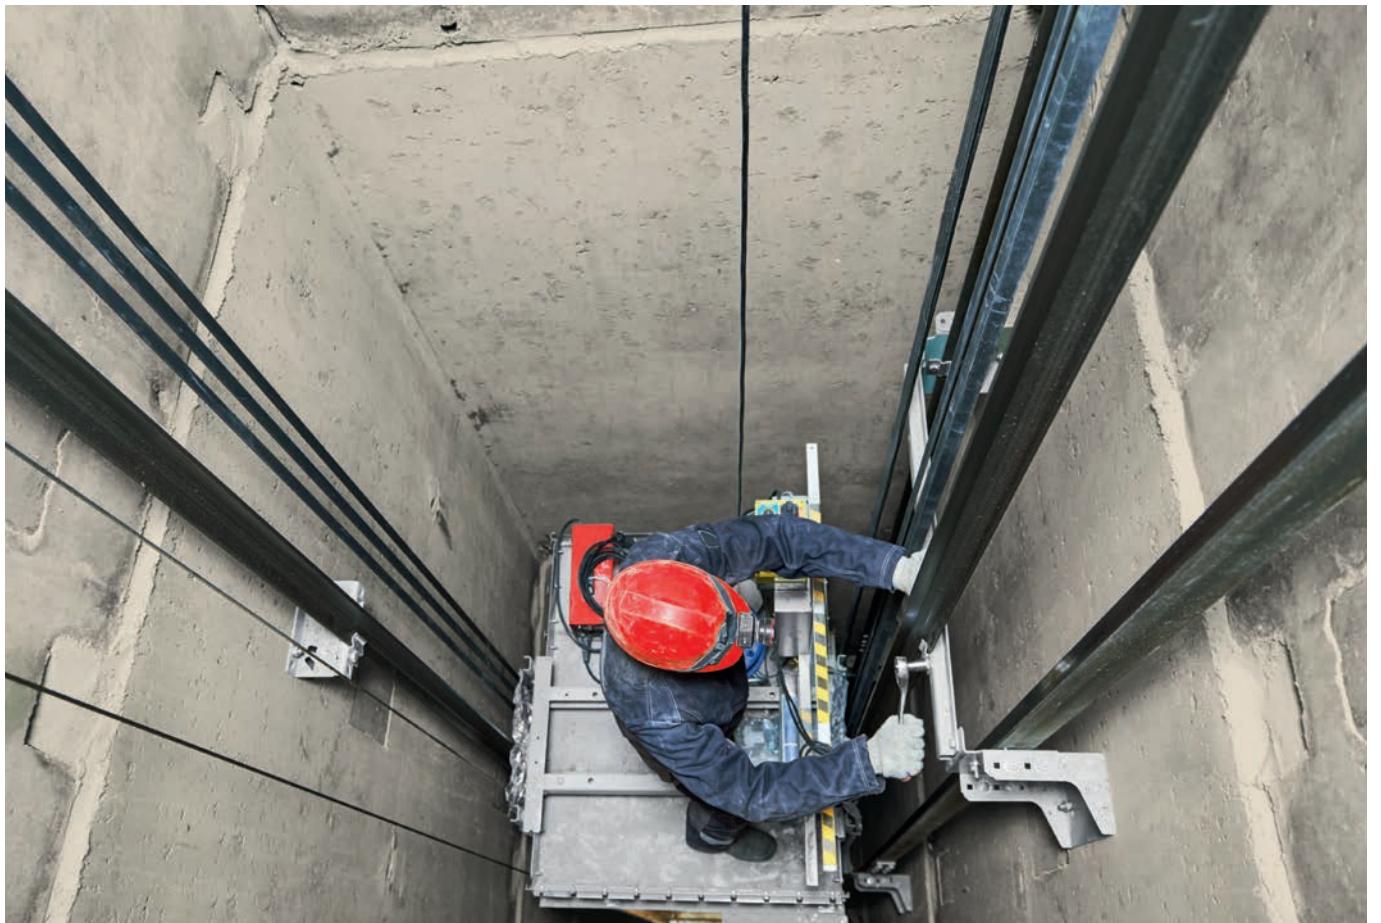

## Requirements for anchorages subject to dynamic loads:

To anchor a component exposed to dynamic loads, plugs approved for primarily non-static load cases must be used in areas covered by construction law. However, this only makes sense if the overall structure is designed for dynamic loads. Currently, such approvals are issued in the form of general building approvals (AbZ), design certifications (Abg) or an European Technical Assessment (ETA), and only for the anchorage substrate concrete.

In contrast to primarily dormant loads, with dynamic lateral loads it is highly important that there is no annular gap between the steel components and plugs, in order to effectively prevent increasing deformation of the anchor due to the changing load. To ensure this, the annular gap between the wall of the borehole in the steel component and the plugs generally needs to be filled with high-strength injection mortar.

Powerful dynamic anchors have a spherical disc and bevelled washer to ensure maximum load-bearing capability under dynamic loads, instead of a normal washer. This allows them to optimally compensate for a minor tilt in the anchor due to installation. This allows for even load transfer and application, in particular under tensile loads. Use of a locking nut is also essential to prevent the load-bearing nut from coming loose accidentally due to vibration, or due to frequent load changes. Anchorages can be designed very economically and easily using the fischer C-FIX design software, which is part of the FiXperience program family.

# Highbond-Anchor dynamic FHB dyn.

## The performance class amongst anchors.

### Your advantages at a glance

- High tensile loads thanks to the conical geometry of the threaded rod.
- High shear loads thanks to an additional sleeve on the version optimized for lateral force FHB-A dyn V.
- The diameters M12 and M16 are approved for use in steel fiber reinforced concrete in accordance with the static ETA and M16 is also approved for seismic performance category C1.
- Version in zinc-plated steel for indoor areas, as well as in highly corrosion-resistant steel 1.4529 for applications outdoors, in moist areas and in atmospheres with a high level of chlorine.
- Easy push-through installation and pre-positioned installation.
- Thanks to the drill hole in the filler disc, the annular gap can be filled subsequently with pre-positioned installation.
- Large assortment in sizes M12 – M24.
- You can use the C-FIX design software to take advantage of the power offered by fischer Highbond dynamic anchors, and complete measurements with individual framework conditions.

FIS HB 360 S  
Highbond special mortar.

dynamic.

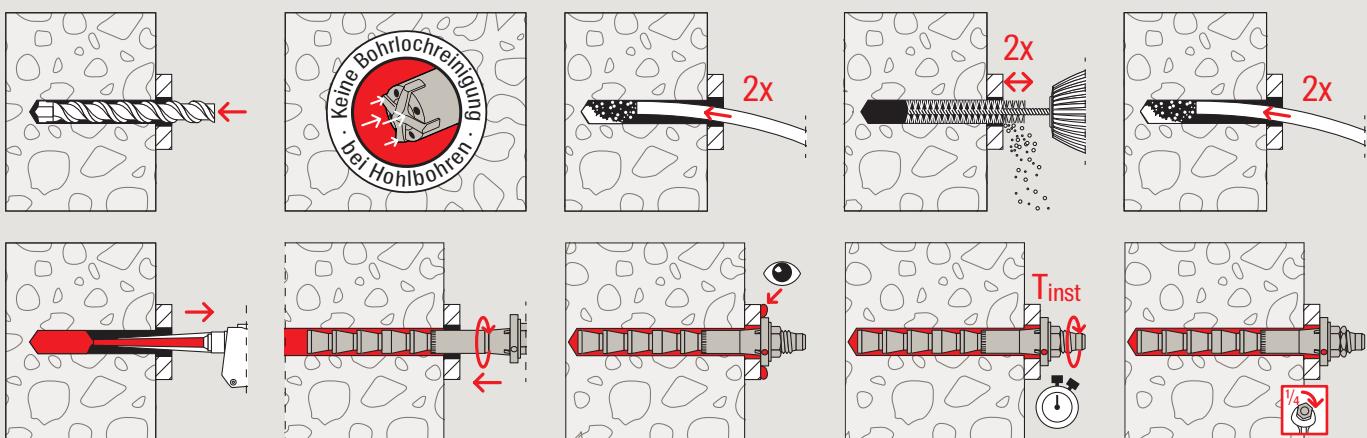

FHB-A dyn V  
Highbond-anchor dynamic  
optimised for lateral forces.

# Installation, functioning and test marks.

## Pre-positioned installation FHB dyn

## Push-through installation FHB dyn

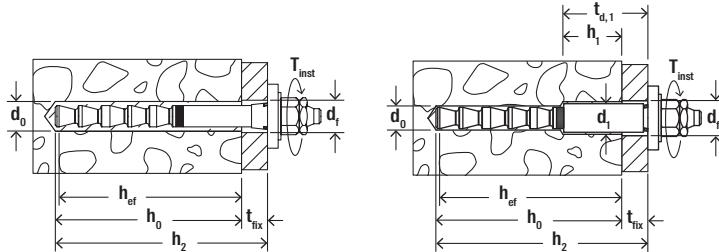

## Function

- The injection system suitable for tensile zones consists of the Highbond dynamic anchor rod FHB-A dyn and the injection mortar FIS HB.
- Extruding the mortar causes the two components to be mixed and activated in the static mixer. The conical threaded rod is inserted manually into the drill hole filled with injection mortar FIS HB and turned back and forth slightly. The mortar pushes past the threaded rod and bonds it completely to the drill hole wall.

# Bonded anchors FSB dyn / FIS EM Plus dyn. Fixing with FIS A and RG M for dynamic loads.

## Your advantages at a glance

- The system offers values for load-bearing capacity under dynamic load in an ETA for fischer threaded rods FIS A and RG M in the strength class 8.8 zinc-plated and stainless steel R-70, using the dynamic set. The ETA requires zinc-plated steel in sizes M12 and M16, and stainless steel R in sizes M12 to M24.
- FIS A threaded rods are mounted with FIS SB / FIS EM Plus injection mortar and RGM threaded rods must be mounted with RSB mortar capsules or FIS SB / FIS EM Plus injection mortar.
- The version with RG M threaded rods and RSB capsules is ideal for accessories kits or applications with diamond drill holes.
- Approved threaded rods in stainless steel R can be used outdoors.
- Variable anchorage depth allows for ideal adaptation to the load, and ensures an optimised installation time and use of materials.
- Low component thickness as well as centre and edge distances.

## Pre-positioned installation RG M with filling set

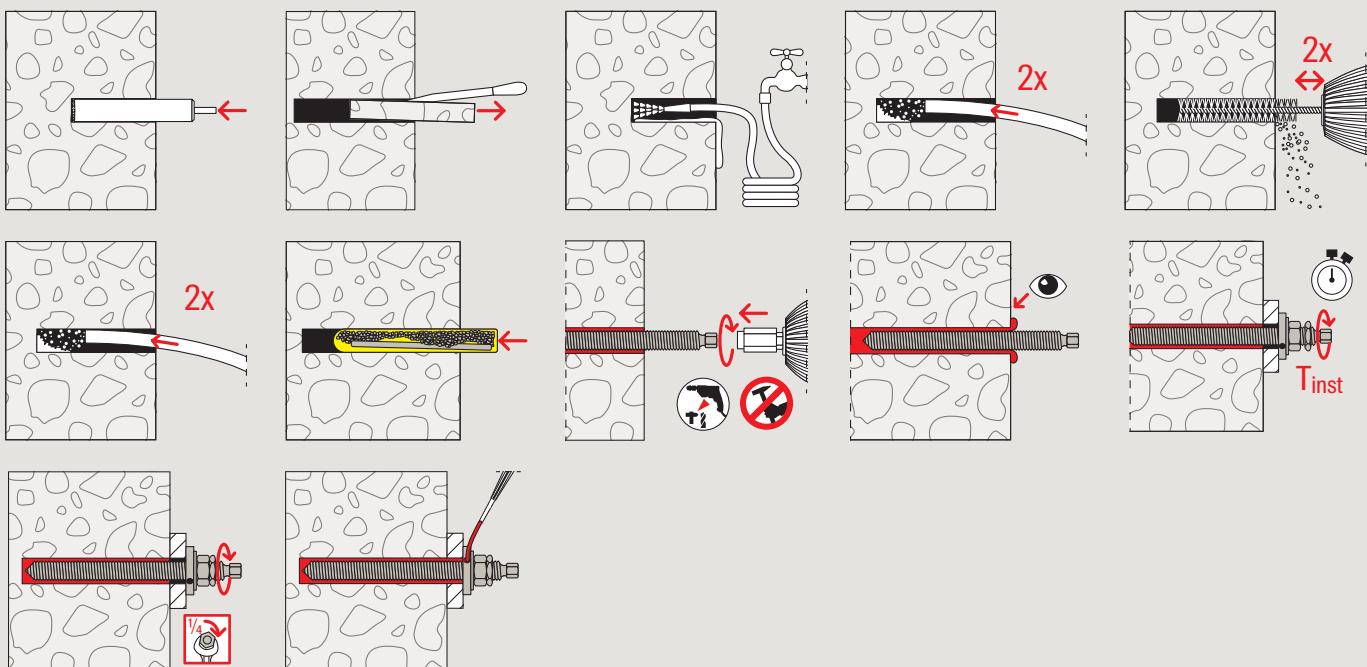

## Push-through installation RG M with filling set

# Installation, functioning and test marks.

## Pre-positioned installation RG M with capsule RSB (diamond drilling)

## Function

- Threaded rod FIS A in combination with FIS SB / FIS EM Plus injection mortar is approved for pre-positioned and push-through installation.
- Threaded rod RG M in combination with the RSB resin capsule is approved for pre-positioned and push-through installation.
- The injection system ensures a full-surface connection between the fixing element and wall of the drill hole, and seals the drill hole.
- The centring sleeve centres the threaded rod in push-through installation in the fixture, thus ensuring a safe load application.
- The lock nut prevents the hexagonal nut from becoming loose.
- The filling disc ensures that the annular gap between the threaded rod and steel attachment is filled seamlessly in pre-positioned installation, thereby ensuring reliable load transmission.

# FAZ II Plus.

## The power anchor for dynamic applications.

Quick and easy installation for higher efficiency as a perfect alternative to injection systems for dynamic stress.

The new ETA confirms the use of the FAZ II Plus for dynamic loads for diameters M16-M24.

### Your advantages at a glance

- The new ETA confirms the use of the FAZ II Plus for dynamic loads for diameters M16-M24 (galvanised steel or stainless steel).
- The fast installation process of the FAZ II Plus provides an efficient fixing solution for dynamic applications with low load cycles with an immediately loadable fixing point.
- Easy and safe installation with Dynamic Set.
- Approved according to German construction type approval (aBG) for applications in steel fiber reinforced concrete.

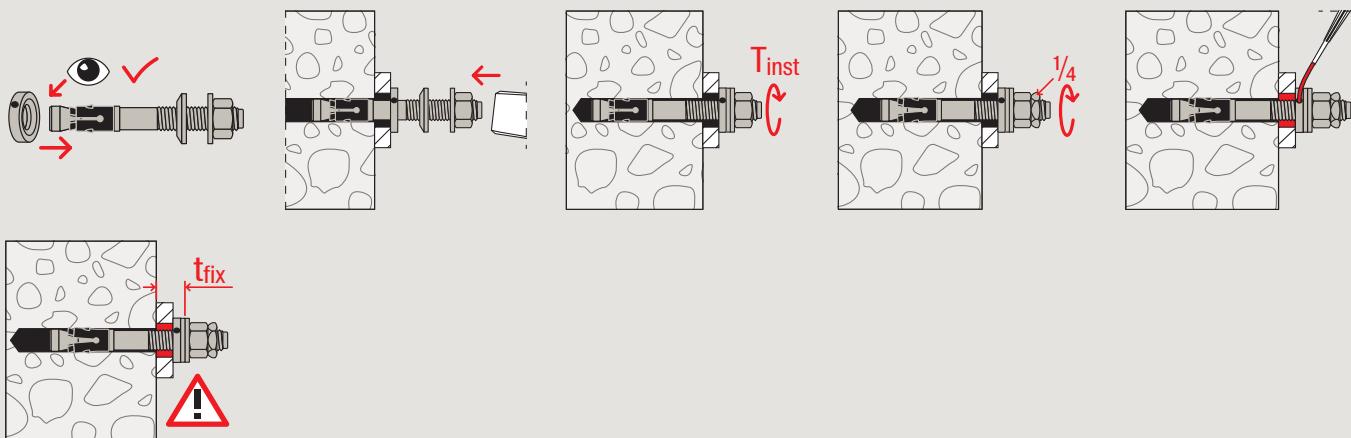

### Functioning

- The FAZ II is suitable for pre-positioned and push-through installation.
- For dynamic loads, an additional „dynamic set“ is used, which is filled with injection mortar (compressive strength  $\geq 50\text{N/mm}^2$  e.g.: FIS V, FIS EM Plus, FIS HB or FIS SB) after installation.

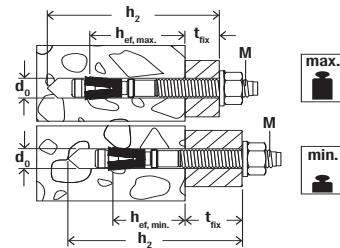

### Approvals

### Mounting with Dynamic Set

<sup>1)</sup> The design values of the cyclic fatigue loading apply for load cycles  $\geq 5 \times 10^6$  in accordance with design method I - for unknown static lower load. If the static lower load is known and / or for lower number of load cycles higher load values are possible. The partial safety factors as regulated in the design standard are considered. As a single anchor counts e.g. an anchor with a spacing  $s \geq 3 \times h_{ef}$ . The given load values apply for anchorages in dry and wet concrete and temperatures in the base material up to 50 °C (resp. short-term up to 80 °C) and drill hole cleaning acc. to approval.

<sup>2)</sup> For higher concrete strength classes up to C50/60 higher permissible loads may be possible, see approval. The concrete is assumed to be standard-reinforced.

<sup>3)</sup> In the case of combinations of tensile loads, shear loads, bending moments with reduced or minimum spacing and edge distances (anchor groups) the design must be carried out in accordance with the provisions of the complete approval.

<sup>4)</sup> Valid for pulsating loads. For alternating loads see approval.

<sup>5)</sup> Without reduction of the tension and shear load. For details see approval.

## Dynamic-Anchor FDA

Design values for cyclic fatigue loading<sup>1)</sup> of a single anchor normal concrete of strength class C20/25<sup>2)</sup>.

For the design the complete current assessment ETA-20/0206 has to be considered.

Type	Material fixing element	Effective anchorage depth $h_{ef}$ [mm]	Minimum member thickness $h_{min}$ [mm]	Installation torque $T_{inst}$ [Nm]	Cracked and non-cracked concrete			
					Design values of tension ( $\Delta N_{Ed,max}$ ) and shear loads ( $\Delta V_{Ed,max}$ ); minimum spacing ( $s_{min}$ ) and edge distances ( $c_{min}$ ) with reduced loads	$\Delta N_{Ed,max}$ <sup>3)</sup> [kN]	$\Delta V_{Ed,max}$ <sup>3)</sup> [kN]	$s_{min}$ <sup>4)</sup> [mm]

<sup>1)</sup> The design values of the cyclic fatigue loading apply for load cycles  $> 10^8$  in accordance with design method I acc. to TR061 – for unknown static lower load. If the static lower load is known and / or for lower number of load cycles higher load values are possible. The partial safety factors as regulated in the design standard are considered. As a single anchor counts e.g. an anchor with a spacing  $s \geq 3 \times h_{ef}$ . The given load values apply for anchorages in dry and wet concrete and temperatures in the base material up to 50 °C (resp. short-term up to 72 °C). Higher loads are possible at lower temperatures. Drilling method and borehole cleaning according to ETA specifications.

<sup>2)</sup> For higher concrete strength classes up to C50/60 higher permissible loads may be possible, see assessment. The concrete is assumed to be standard-reinforced.

<sup>3)</sup> In the case of combinations of tensile loads, shear loads, bending moments with reduced or minimum spacing and edge distances (anchor groups) the design must be carried out in accordance with the provisions of the complete ETA. We recommend using our anchor design software C-FIX.

# Loads

## Superbond dynamic with Superbond mortar FIS SB and threaded rod FIS A resp. RG M

Design values for cyclic fatigue loading<sup>1)</sup> of a single anchor normal concrete of strength class C20/25<sup>2)</sup>.

For the design the complete current assessment ETA-19/0501 has to be considered.

# fischer PRO.

## The mobile fixing expert.

[www.fischer-international.com](http://www.fischer-international.com)

# Our 360° service to you.

From software solutions, to training, to personal consulting. As a reliable partner, we are always happy to assist you with words and deeds.

## Your advantages:

- Our products range from chemical resin systems to steel anchors through to nylon anchors.
- Competence and innovation through own research, development and production.
- Global presence and active sales service in over 100 countries.
- Qualified technical consulting for economical and compliant fastening solutions. Also on-site at the construction site if requested.
- Training sessions, some with accreditation, at your premises or at the fischer academy.
- Design and construction software for demanding applications.

# Design Software fischer FiXperience.

The fischer design Software FiXperience gives you safe and reliable support in measuring your projects whether you are a planer, structural engineer or craftsman. Measuring has never been so simple!

## Software and modules for your daily work.

- The modular design program includes engineering software and application modules.
- The software is based on international design standards (EN 1992-4, EC1, EC2, EC3 and EC5), including the national application documents. All common force and measurement units are available.
- Incorrect input will be recognized and the software gives tips to get a correct result. This ensures a safe and reliable design every time.
- The graphical display can easily be rotated through 360°, panned, tilted or zoomed as required.
- The 3D display gives a detailed and realistic image.
- The “live update” feature helps to keep the program up to date ensuring you are always working with the latest version.
- Free download and updates at: [www.fischer.de/fixperience-en](http://www.fischer.de/fixperience-en)
